**Spectroscopy of Crystals Containing Rare Earth Ions** A.A. Kaplyanskii, R.M. McFarlane, 2012-12-02 Spectroscopy of Crystals Containing Rare Earth Ions contains chapters on some key problems selected from a broad range of spectroscopic studies of RE activated solids including both crystalline and glassy materials Progress in crystal field theory is surveyed an area which is basic to our understanding of the energy levels The treatment of dynamical properties includes studies of coherence phenomena in isolated ions energy transfer between ions and cooperative phenomena associated with ion-ion and ion-lattice interactions In addition the role of electron spins and nuclear spins is studied by light scattering and double resonance techniques The presence of inhomogeneous broadening of spectral lines is observed and studied in many contexts leading to new insights into general problems of the disordered state Considerable attention is devoted to describing new experimental techniques whose development is of prime importance for progress in the spectroscopy of RE

activated solids Many of these rely on the development and application of tunable lasers At the moment this is a very active field of spectroscopy with more exciting developments likely to occur in the future

Рост Кристаллов / Rost Kristallov / Growth of Crystals A. A. Chernov,2012-12-06 Volumes 11 and 12 contain the papers read at the Fourth All Union Conference on Crystal Growth in Tsakhkadzor September 17 22 1972 this volume contains papers on crystal growth from melts from low temperature

solutions hydrothermal solutions and hot solutions and also from the gas state including processes involving reactions In addition there are papers on crystal perfection in relation to conditions of formation and the effects of electric and magnetic fields on crystallization These papers reflect researches directed to the development and industrial production of perfect crystals required for advanced techniques in solid state physics and chemistry as well as for other purposes such as novel materials There are many different scientific and technical problems in producing large perfect single crystals and advances in this area made in the USSR and elsewhere are reflected in the papers in both volumes On the one hand any particular defective structure in a crystal originates from some mechanism and growth conditions in particular inclusions are trapped on account of the physicochemical parameters of the melt the surface processes and the stability of the growth front under particular crystallization conditions Further impurity trapping is decisively influenced by the surface kinetics growth front stability composition and structure of the boundary layer any complexes present in the liquid and of course the crystallochemical relationships between the impurity and the crystal

**Creation and Accumulation of Radiation Defects in Single Crystals of Magnesium Oxide** Anatoly Surzhikov, Elena Lysenko, 2024-06-04 The range of problems that can be solved with the use of powerful radiation installations is determined generation of nanosecond ultrahigh frequency microwave pulses collective acceleration of charged particles the implementation of a controlled fusion reaction and the creation of high power lasers In this edition the questions posed for the SCM were solved using the example of single crystals of magnesium oxide By the beginning of the authors work the structure of the color centers induced by radiation in magnesium oxide the positions of the maxima of the optical absorption and luminescence bands as well as the values of their half widths and the temperature range of stability were sufficiently established There is practically no information about the location of interstitial ions in magnesium oxide crystals and methods for their registration have not been worked out These data are particularly important since the efficiency of the accumulation of radiation defects depends to a certain extent on the efficiency of fixing displaced ions in the crystal lattice However all studies confirming this point of view were carried out using low and medium levels of irradiation The effect of high absorbed radiation energy capacities on the formation and accumulation of radiation defects in magnesium oxide crystals has not been practically studied

Laser Spectroscopy of Solids W. M. Yen, P. M. Selzer, 2013-03-09 In this volume we have attempted to present a concise survey of the spectroscopic properties of insulators as derived from the application of tunable laser spectroscopic techniques As has been the case in gaseous atomic spectroscopy the use of tunable lasers has allowed the extension and the refinement of optical measurements in the condensed phases to unprecedented resolutions in the frequency and temporal domains In turn this firmer base of empirical findings has led to a more sophisticated theoretical understanding of the spectroscopy of optically excited states with major modifications being apparent in the area of their dynamic behavior Yet the revivalistic nature of these advances implies that additional advances are to be expected as the techniques and developments outlined in this volume are put to

widespread use Regardless it is our hope and that of our distinguished colleagues in this venture that the reviews presented here will be useful to neo phytes and veterans to this field alike to the former as a laissez passer into solid state spectroscopy to the latter as a useful synopsis and reference of recent developments We have also attempted to expose the reader to the concept that optically active materials be they organic or inorganic as universality would require be have in a like manner and though terminology may vary in detail the outline and general features of all insulators remain constant

**Diamonds from the Arkhangelsk Province, NW Russia** Victor Garanin,Konstantin Garanin,Galina Kriulina,George Samosorov,2021-07-19 This book examines and summarizes data on more than 40 000 diamonds from deposits in Russia s diamondiferous Arkhangelsk province The geological data of diamond deposits includes the geological setting ore body morphology and mineral composition Investigation techniques employed include Color Cathode Luminescence Fourier Transform Infrared Spectroscopy Electron Paramagnetic Resonance Raman Spectroscopy and Carbon Isotopy The book provides a full description of the diamond morphology The problems of a potential mantle diamond grade for deposits are considered depending on the physical and chemical conditions involved in the genesis and growth of diamond crystals Further there can be a significant impact on the productivity of bodies and the properties of diamonds during post crystallization metasomatic processes In this book the authors propose a diamond crystallization model for changes in

diamond crystals within mantle metasomatic transformations and identify the factors affecting the growth and dissolution of diamonds in the mantle In addition they describe the complex evolution of kimberlite from the mantle up to the Earth s surface All of these factors affect the quality and quantity of diamonds in a particular diamond deposit providing the basis for identifying optimal technological mining processes
