Machine Learning Of Robot Assembly Plans:

Machine Learning of Robot Assembly Plans Alberto Maria Segre, 2012-12-06 The study of artificial intelligence AI is indeed a strange pursuit Unlike most other disciplines few AI researchers even agree on a mutually acceptable definition of their chosen field of study Some see AI as a sub field of computer science others see AI as a computationally oriented branch of psychology or linguistics while still others see it as a bag of tricks to be applied to an entire spectrum of diverse domains This lack of unified purpose among the AI community makes this a very exciting time for AI research new and diverse projects are springing up literally every day As one might imagine however this diversity also leads to genuine difficulties in assessing the significance and validity of AI research These difficulties are an indication that AI has not yet matured as a science it is still at the point where people are attempting to lay down hopefully sound foundations Ritchie and Hanna 1 posit the following categorization as an aid in assessing the validity of an AI research endeavor 1 The project could introduce in outline a novel or partly novel idea or set of ideas 2 The project could elaborate the details of some approach Starting with the kind of idea in 1 the research could criticize it or fill in further details 3 The project could be an AI experiment where a theory as in 1 and 2 is applied to some domain Such experiments are usually computer programs that implement a particular theory

Recent Advances in Robot Learning Judy A. Franklin, Tom M. Mitchell, Sebastian Thrun, 2012-12-06 Recent Advances in Robot Learning contains seven papers on robot learning written by leading researchers in the field As the selection of papers illustrates the field of robot learning is both active and diverse A variety of machine learning methods ranging from inductive logic programming to reinforcement learning is being applied to many subproblems in robot perception and control often with objectives as diverse as parameter calibration and concept formulation While no unified robot learning framework has yet emerged to cover the variety of problems and approaches described in these papers and other publications a clear set of shared issues underlies many robot learning problems Machine learning when applied to robotics is situated it is embedded into a real world system that tightly integrates perception decision making and execution Since robot learning involves decision making there is an inherent active learning issue Robotic domains are usually complex yet the expense of using actual robotic hardware often prohibits the collection of large amounts of training data Most robotic systems are real time systems Decisions must be made within critical or practical time constraints These characteristics present challenges and constraints to the learning system Since these characteristics are shared by other important real world application domains robotics is a highly attractive area for research on machine learning On the other hand machine learning is also highly attractive to robotics There is a great variety of open problems in robotics that defy a static hand coded solution Recent Advances in Robot Learning is an edited volume of peer reviewed original research comprising seven invited contributions by leading researchers This research work has also been published as a special issue of Machine Learning Volume 23 Numbers 2 and 3

Machine Learning Ryszard S. Michalski, George Tecuci, 1994-02-09 Multistrategy learning is one of the newest and most promising research directions in the development of machine learning systems The objectives of research in this area are to study trade offs between different learning strategies and to develop learning systems that employ multiple types of inference or computational paradigms in a learning process Multistrategy systems offer significant advantages over monostrategy systems They are more flexible in the type of input they can learn from and the type of knowledge they can acquire As a consequence multistrategy systems have the potential to be applicable to a wide range of practical problems This volume is the first book in this fast growing field It contains a selection of contributions by leading researchers specializing in this area See below for earlier volumes in the series Machine Learning Yves Kodratoff, Ryszard S. Michalski, 2014-06-28 Machine Learning An Artificial Intelligence Approach Volume III presents a sample of machine learning research representative of the period between 1986 and 1989 The book is organized into six parts Part One introduces some general issues in the field of machine learning Part Two presents some new developments in the area of empirical learning methods such as flexible learning concepts the Protos learning apprentice system and the WITT system which implements a form of conceptual clustering Part Three gives an account of various analytical learning methods and how analytic learning can be applied to various specific problems Part Four describes efforts to integrate different learning strategies These include the UNIMEM system which empirically discovers similarities among examples and the DISCIPLE multistrategy system which is capable of learning with imperfect background knowledge Part Five provides an overview of research in the area of subsymbolic learning methods Part Six presents two types of formal approaches to machine learning The first is an improvement over Mitchell's version space method the second technique deals with the learning problem faced by a robot in an unfamiliar deterministic finite state environment Intelligent Robots - Sensing, Modeling And Planning Bob Bolles, Horst Bunke, Hartmut Noltemeier, 1997-12-04 Rapid advances in sensors computers and algorithms continue to fuel dramatic improvements in intelligent robots In addition robot vehicles are starting to appear in a number of applications

For example they have been installed in public settings to perform such tasks as delivering items in hospitals and cleaning floors in supermarkets recently two small robot vehicles were launched to explore Mars This book presents the latest advances in the principal fields that contribute to robotics It contains contributions written by leading experts addressing topics such as Path and Motion Planning Navigation and Sensing Vision and Object Recognition Environment Modeling and others

Robotics Research Raymond Austin Jarvis, Alex Zelinsky, 2003-09-05 At the dawn of the new millennium robotics is undergoing a major transformation in scope and dimension From a largely dominant industrial focus robotics is rapidly expanding into the challenges of unstructured environments Interacting with assisting serving and exploring with humans the emerging robots will increasingly touch people and their lives The goal of this new series of Springer Tracts in Advanced Robotics is to bring in a timely fashion the latest advances and developments in robotics on the basis of their significance and quality It is our hope that the greater dissemination of research developments will stimulate more exchanges and collaborations among the research community and contribute to further advancement of this rapidly growing field As one of robotics pioneering symposia ISRR the International Symposium on Robotics Research has established over the past two decades some of the field s most fundamental and lasting contributions With the launching of STAR this and other thematic symposia devoted to excellence in robotics and an important platform for closer links and extended reach within the research community The Tenth edition of Robotics Research edited by Raymond Jarvis and Alex Zelinsky offers in its 11 part volume a collection of a broad range of topics in robotics The content of these contributions provides a wide coverage of the current state of robotics research the advances and challenges in its theoretical foundation and technology basis and the developments in its traditional and new areas of applications

Foundations of Knowledge Acquisition Alan L. Meyrowitz, Susan Chipman, 2007-08-19 One of the most intriguing questions about the new computer technology that has appeared over the past few decades is whether we humans will ever be able to make computers learn As is painfully obvious to even the most casual computer user most current computers do not Yet if we could devise learning techniques that enable computers to routinely improve their performance through experience the impact would be enormous The result would be an explosion of new computer applications that would suddenly become economically feasible e g personalized computer assistants that automatically tune themselves to the needs of individual users and a dramatic improvement in the quality of current computer applications e g imagine an airline scheduling program that improves its scheduling method based on analyzing past delays And while the potential economic impact of successful learning methods is sufficient reason to invest in research into machine learning there is a second significant reason studying machine learning helps us understand our own human learning abilities and disabilities leading to the possibility of improved methods in education While many open questions remain about the methods by which machines and humans might learn significant progress has been made
