A Derivative-free Two Level Random Search Method for Unconstrained Optimization Neculai Andrei,2021-03-31 The book is intended for graduate students and researchers in mathematics computer science and operational research The book presents a new derivative free optimization method algorithm based on randomly generated trial points in specified domains and where the best ones are selected at each iteration by using a number of rules This method is different from many other well established methods presented in the literature and proves to be competitive for solving many unconstrained optimization problems with different structures and complexities with a relative large number of variables Intensive numerical experiments with 140 unconstrained optimization problems with up to 500 variables have shown that this approach is efficient and robust Structured into 4 chapters Chapter 1 is introductory Chapter 2 is dedicated to presenting a two level derivative free random search method for unconstrained optimization It is assumed that the minimizing function is continuous lower bounded and its minimum value is known Chapter 3 proves the convergence of the algorithm In Chapter 4 the numerical performances of the algorithm are shown for solving 140 unconstrained optimization problems out of which 16 are real applications This shows that the optimization process has two phases the reduction phase and the stalling one Finally the performances of the algorithm for solving a number of 30 large scale unconstrained optimization problems up to

500 variables are presented These numerical results show that this approach based on the two level random search method for unconstrained optimization is able to solve a large diversity of problems with different structures and complexities There are a number of open problems which refer to the following aspects the selection of the number of trial or the number of the local trial points the selection of the bounds of the domains where the trial points and the local trial points are randomly generated and a criterion for initiating the line search

Nonlinear Optimization with Engineering Applications Michael Bartholomew-Biggs,2008-12-16 This book like its companion volume Nonlinear Optimization with Financial Applications is an outgrowth of undergraduate and po graduate courses given at the University of Hertfordshire

and the University of Bergamo It deals with the theory behind numerical methods for nonlinear optimization and their application to a range of problems in science and engineering The book is intended for nal year undergraduate students in mathematics or other subjects with a high mathematical or computational content and exercises are provided at the end of most sections The material should also be useful for postgraduate students and other researchers and practitioners who may be concerned with the development or use of optimization algorithms It is assumed that readers have an understanding of the algebra of matrices and vectors and of the Taylor and mean value theorems in several variables Prior experience of using computational techniques for solving systems of linear equations is also desirable as is familiarity with the behaviour of iterative algorithms such as Newton's method for nonlinear equations in one variable Most of the currently popular methods for continuous nonlinear optimization are described and given at least an intuitive justification Relevant convergence results are also outlined and we provide proofs of these when it seems instructive to do so This theoretical material is complemented by numerical illustrations which give a flavour of how the methods perform in practice

Numerical Methods for Constrained and Unconstrained Optimization Paul T. Boggs, Jon W. Tolle, NORTH CAROLINA UNIV AT CHAPEL HILL., 1982 The main thrust of the research has been toward the development of efficient algorithms for solving the finite dimensional constrained optimization problem Historically problems of this type have been solved by either penalty function methods or through linearization procedures The fact that neither of these techniques is completely satisfactory for general nonlinear problems has lead to a concentrated research effort to find better approaches What has so far emerged from this work is a blending of the penalty function and linearization ideas with the quadratic approximation methods associated with unconstrained optimization While there remain many unresolved issues it is now apparent that this synthesis has resulted in more efficient algorithms for the nonlinear constrained optimization problem Author
