Numerical Solution of the Incompressible Navier-Stokes Equations L. Quartapelle, 2012-02-06 This book presents different formulations of the equations governing incompressible viscous flows in the form needed for developing numerical solution procedures The conditions required to satisfy the no slip boundary conditions in the various formulations are discussed in detail Rather than focussing on a particular spatial discretization method the text provides a unitary view of several methods currently in use for the numerical solution of incompressible Navier Stokes equations using either finite differences finite elements or spectral approximations For each formulation a complete statement of the mathematical problem is provided comprising the various boundary possibly integral and initial conditions suitable for any theoretical and or computational development of the governing equations The text is suitable for courses in fluid mechanics and computational fluid dynamics It covers that part of the subject matter dealing with the equations for incompressible viscous flows and their determination by means of numerical methods A substantial portion of the book contains new results and unpublished material

Numerical Solutions of the Incompressible Navier-Stokes Equations in Two and Three-Dimensional Coordinates Alexander Victor, 2017 One of the most important applications of finite difference lies in the field of computational fluid dynamics CFD In particular the solution to the Navier Stokes equation grants us insight into the behavior of many physical systems The 2 D and 3 D incompressible Navier Stokes equation has been studied extensively due to its analogous nature to many practical applications and several numerical schemes have been developed to provide solutions dedicated to different environmental conditions such as different Reynolds numbers This research also covers the assignment of boundary conditions starting with the simple case of driven cavity flow problem In addition several parts of the equations are given implicitly which requires efficient ways of solving large systems of equations We also considered numerical solution methods for the incompressible Navier Stokes equations discretized on staggered grids in general coordinates Numerical experiments are carried out on a vector computer Robustness and efficiency of these methods are studied It appears that good methods result from suitable combinations of multigrid methods Numerically solving the incompressible Navier Stokes equations is

known to be time consuming and expensive hence this research presents some MATLAB codes for obtaining numerical solution of the Navier Stokes equations for incompressible flow through flow cavities using method of lines in three dimensional space 3 D The code treats the laminar flow over a two dimensional backward facing step and the results of the computations over the backward facing step are in excellent agreement with experimental results *A Fully Vectorized Numerical Solution of the Incompressible Navier-Stokes Equations* Nisheeth Patel, Mississippi State University, Langley Research Center, 1983 Numerical Solution of the Incompressible Navier-Stokes Equations Stuart Eames Rogers, 1989

Numerical Solution of the Incompressible Navier-Stokes Equations with Coriolis Forces Based on the Discretization of the Total Time Derivate Ramon Codina Rovira,1997 A New Method for the Solution of the Incompressible Navier-Stokes Equations Hazem Said,2001 Numerical Solution of the incompressible Navier Stokes INS equations in primitive variables requires special care to ensure that the resulting flow field will satisfy the discrete governing equations DGE However these equations are not satisfied by the existing solution methods thus requiring the need to develop a new method A new method is developed in this work to solve the INS equations in primitive variables The method uses the velocity and pressure gradients as dependent variables compared to velocity and pressure that are used by all other primitive variables methods These new dependent variables require additional constraint to be determined The condition of irrotationality of the gradient of the pressure is employed to give the necessary equations to close the problem Thus the flow field is represented by a new set of equations that when solved together produces a solution that satisfies the DGE of the present method are summarized as follows 1 it eliminates the compatability condition of the pressure equation typical of all pressure based techniques 2 it satisfies the discrete continuity and momentum equations 3 Boundary conditions are physically known for all the dependent variables 4 It eliminates the inversion of the implicit operator typical of the implicit primitive variables formulation 5 Robust stable and more accurate computational codes can be developed Numerical results are obtained for the driven cavity problem using both the explicit and the implicit forms of the method Results are obtained for Reynolds numbers of 100 400 and 1000 These results show that the present method produces a stable solution and that the resulting flow field does satisfy the DGE to machine zero Numerical Solutions for the Incompressible Navier-Stokes Equations [microform] Ming Li,1998
