VLSI: Systems on a Chip Luis Miguel Silveira,Srinivas Devadas,Ricardo A. Reis,2013-11-11 For over three decades now silicon capacity has steadily been doubling every year and a half with equally staggering improvements continuously being observed in operating speeds This increase in capacity has allowed for more complex systems to be built on a single silicon chip Coupled with this functionality increase speed improvements have fueled tremendous advancements in computing and have enabled new multi media applications Such trends aimed at integrating higher levels of circuit functionality are tightly related to an emphasis on compactness in consumer electronic products and a widespread growth and interest in wireless communications and products These trends are expected to persist for some time as technology and design methodologies continue to evolve and the era of Systems on a

Chip has definitely come of age While technology improvements and spiraling silicon capacity allow designers to pack more functions onto a single piece of silicon they also highlight a pressing challenge for system designers to keep up with such amazing complexity To handle higher operating speeds and the constraints of portability and connectivity new circuit techniques have appeared Intensive research and progress in EDA tools design methodologies and techniques is required to empower designers with the ability to make efficient use of the potential offered by this increasing silicon capacity and complexity and to enable them to design test verify and build such systems *Energy-Aware Communications* Ralf Lehnert,2011-09-01 This book constitutes the refereed proceedings of the 17th EUNICE 2011 Workshop on energy aware communications held in Dresden in September 2011 The proceedings comprise 16 full papers and 7 poster papers which are presented together with the abstracts of the 3 invited talks The topics covered are network architectures ad hoc and wireless networks system simulation network planning optimization and migration traffic engineering quality of experience and energy efficient architectures

Embedded Systems Design Bruno Bouyssounouse,Joseph Sifakis,2005-02-07 Embedded systems now include a very large proportion of the advanced products designed in the world spanning transport avionics space automotive trains electrical and electronic appliances cameras toys televisions home appliances audio systems and cellular phones process control energy production and distribution factory automation and optimization telecommunications satellites mobile phones and telecom networks and security e commerce smart cards etc The extensive and increasing use of embedded systems and their integration in everyday products marks a significant evolution in information science and technology We expect that within a short timeframe embedded systems will be a part of nearly all equipment designed or manufactured in Europe the USA and Asia There is now a strategic shift in emphasis for embedded systems designers from simply achieving feasibility to achieving optimality Optimal design of embedded systems means targeting a given market segment at the lowest cost and delivery time possible Optimality implies seamless integration with the physical and electronic environment while respecting real world constraints such as hard deadlines reliability availability robustness power consumption and cost In our view optimality can only be achieved through the emergence of embedded systems as a discipline in its own right
