Victor P. Bond, J.W. Thiessen, 1982 **Nuclear Safety** ,1983 **For the Record** F. Gladeck, 1996 **Assessment of Risk from Low-Level Exposure to Radiation and Chemicals** A. D. Woodhead, 2013-11-21 The present workshop had its origins in discussions among Alexander Hollaender Oddvar Nygaard Donald Borg Richard Setlow and Victor Bond on the need for a symposium that would deal with a broad spectrum of pressing subjects related to the physics chemistry and biological

actions of ionizing radiations and the theoretical and practical problems of risk assessment. It soon became apparent that the spectrum of subjects considered was too broad for the desired depth of coverage. In fact, it seemed unlikely that the conference participants would have the background knowledge to span the gamut. Therefore, two separate meetings were decided upon, the first of which, Comparison of Mechanisms of Carcinogenesis by Radiation and Chemical Agents, was held at the National Bureau of Standards Gaithersburg on December 6-7, 1983. The meeting was sponsored by the NCI. The second meeting has emerged as the present workshop at Brookhaven National Laboratory. An interface between the two conferences has been provided by Michael Fry and Donald Borg who have summarized the salient points emanating from the NCI Symposium. We intended that the first conference should focus on the basic mechanisms of radiation and chemical carcinogenesis while the second, the present meeting, would emphasize exposure-response relationships, particularly the theoretical and practical similarities and differences between exposure to chemical carcinogens compared to exposure to ionizing radiation.

The Dragon's Tail Barton C. Hacker, 1987-01-01. Discusses tolerance and protection standards and looks at the Los Alamos and Trinity testing sites.

**Biological Dosimetry** W. G. Eisert, M. L. Mendelsohn, 2012-12-06. In October 1982, a small international symposium was held at the Gesellschaft für Strahlen und Umweltforschung mbH GSF in Munich as a satellite meeting of the IX International Conference on Analytical Cytology. The symposium focussed on cytometric approaches to biological dosimetry and was to the best of our knowledge the first meeting on this subject ever held. There was strong encouragement from the 75 attendees and from others to publish a proceedings of the symposium. Hence, this book containing 30 of the 36 presentations has been assembled.

Dosimetry: the accurate and systematic determination of doses usually refers to grams of substance administered or rads of ionization or some such measure of exposure of a patient, a victim, or an experimental system. The term also can be used to describe the quantity of an ultimate active agent as delivered to the appropriate target material within a biological system. Thus, for mutagens, one can speak of DNA dosimetry, meaning the number of adducts produced in the DNA of target cells such as bone marrow stem cells or spermatogonia.

*For the Record* Abby A. Johnson, 1986. *Response of Different Species to Total Body Irradiation* J. J. Broerse, T. J. Macvittie, 2012-12-06. J. J. Broerse, Radiobiological Institute TNO, Rijswijk, The Netherlands, and T. J. Macvittie, Armed Forces Radiobiology Research Institute, Bethesda, MD, USA. During the past decade, relatively few new studies have been initiated on the response of different species to high-dose total body irradiation. For information on the LD<sub>50</sub> 30d, the dose which produces 50 percent lethality within 30 days, one is generally referred to the older literature, e.g., Bond, Fliedner, and Archambeau, 1965. Comparison of experimental data reveals considerable variations in LD<sub>50</sub> values even after total body irradiation with conventional X-rays, ranging from 4 to 6 Gy in the monkey, 7.1 to 9 Gy in the rat, and from 6.4 to 9 Gy in the mouse. See also Hall, 1978. Part of the discrepancy in the LD<sub>50</sub> values can possibly be attributed to inadequacies in the dosimetry procedures and exposure arrangements employed. As far as clinical experience is concerned, there is now an

appreciable amount of information available about the effect of total body irradiation as a conditioning treatment for bone marrow transplantation in patients suffering from leukaemia or aplastic anaemia. The results from different centres including the incidence of complications such as radiation pneumonitis are considerably different. This can partly be connected with the application of different radiation schedules: large single dose versus fractionated or protracted irradiation.
