Recent Developments In Insect Neurohormones:

Recent Developments in Insect Neurohormones M. Raabe, 2012-12-06 The most striking fact revealed by investigations of insect neurohormones is that insects are as well supplied with neurohormones as mammals since neurohormones regulate not only the functioning of the endocrine glands prothoracic gland and corpora allata but also most physiological processes Our knowledge of neurohormones developed originally from anatomocytological investigations and experimental studies Today accurate bio assays have been devised for studying both in vivo and in vitro physiological processes and RIA determination has yielded knowledge of titer modifications of humoral factors Much is also known about neurohormone purification and several neurohormones have even been identified in different species Immunocytochemistry has made it possible to demonstrate in their origin and release sites the presence of insect neurohormones whose structure has been elucidated Moreover the presence of vertebrate and invertebrate neuropeptides has been demonstrated in insects As regards biogenic amines methods of detection have been greatly refined and it is now possible to identify the cell bodies and axons of the main biogenic amines Other new methods such as cobalt chloride impregnation or Lucifer yellow staining have revealed the axonal pathways and the location of particular neurons The mechanisms of action of neurohormones have been investigated in several cases and the results of these investigations will be related in the chapters which follow

Insects at Low Temperature Richard Lee, 2012-12-06 The study of insects at low temperature is a comparatively new field Only recently has insect cryobiology begun to mature as research moves from a descriptive approach to a search for underlying mechanisms at diverse levels of organization ranging from the gene and cell to ecological and evolutionary relationships Knowledge of insect responses to low temperature is crucial for understanding the biology of insects living in seasonally varying habitats as well as in polar regions It is not possible to precisely define low temperature In the tropics exposure to 10-15 °C may induce chill coma or death whereas some insects in temperate and polar regions remain active and indeed even able to fly at 0 °C or below In contrast for persons interested in cryopreservation low temperature may mean storage in liquid nitrogen at -196 °C In the last decade interest in adaptations of invertebrates to low temperature has risen steadily In part this book had its origins in a symposium on this subject that was held at the annual meeting of the Entomological Society of America in Louisville Kentucky USA in December 1988 However the emergence and growth of this area has also been strongly influenced by an informal group of investigators who met in a series of symposia held in Oslo Norway in 1982 in Victoria British Columbia Canada in 1985 and in Cambridge England in 1988 Another is scheduled for Binghamton New York USA 1990

The ... Yearbook of Agriculture, 1986 *Research for Tomorrow*, 1986 *Hemolymph Proteins and Functional Peptides* Muhammad Tufail, Makio Takeda, 2012 Recent molecular studies have revealed an overwhelming role of hemolymph proteins and functional peptides in invertebrate physiology This is mainly due to the large assortment of biomolecular factors each with a different structure and function In addit
