Recent Advances in Chiral Separations D. Stevenson, I.D. Wilson, 2012-12-06 This volume represents the proceedings of the second international meeting on chiral separations held at the University of Surrey between the 12th and 15th of September 1989 Like the preceding meeting it was jointly organised by the Chromatographic Society and the Robens Institute of the University of Surrey in response to the continued interest in this area of separation science Of particular interest to the organisers was the very clear change in the nature of the delegates attending this second symposium as compared with the first At the previous meeting the majority of the delegates were composed of chromatographers with problems in the area of chiral separations who were keen to learn as much as possible about these techniques from the handful of recognised experts in this area In this second symposium the divide between expert and novice was much less apparent with the latter providing many interesting and useful contributions to the scientific programme in terms of both oral and poster presentations

National Library of Medicine Current Catalog National Library of Medicine (U.S.),1992 *Highly Selective Separations in Biotechnology* G. Street,2012-12-06 Success in meeting the challenge to produce the commercial products anticipated by the exploitation of biological processes depends upon providing effective separation protocols Effectiveness can be measured in terms of selectivity purity resolution and validity success The major processing problems are associated with either the selective recovery of molecules which are present in low concentrations from complex mixtures or the selective removal of contaminants from the desired molecule Central to the evolution of processes satisfying this demand are the

regulatory requirements being imposed by governments on the purity of a product especially in the health care market Synthetic organic chemists are increasingly finding it advantageous to conduct one or more steps using either enzymic biotransformations where molecules with a single and consistent stereochemistry or chirality are required The underlying principles behind the methods techniques and processes currently being used and developed commercially rely upon the biospecific nature and properties of the desired molecule When these factors are married to the more traditional techniques of precipitation chromatography liquid liquid extraction and membrane processes powerful tools emerge allowing highly selective separations to be designed The logical extension of these combinations is to apply genetic engineering techniques to influence the separations at a more fundamental and structural level by modifying the target protein at source during its synthesis to facilitate its separation in a given selective manner leading to the distinct possibility of producing designer separation programmes
