## **Recent Developments In High Temperature Superconductivity:**

*Recent Developments in High Temperature Superconductivity* Jan Klamut, 1996-09-17 This book contains review articles presenting the current status of high temperature superconductivity research. The articles cover synthesis, issues, materials properties, and most fundamental theoretical problems. Applications of high temperature superconductors are also reflected in several contributions. The book addresses researchers working in fundamental research in solid state physics as well as engineers developing new materials for industrial applications.

### **Recent Developments in Superconductivity Research**

Barry P. Martins, 2007 Superconductivity is the ability of certain materials to conduct electrical current with no resistance and extremely low losses. High temperature superconductors such as  $\text{La}_{2-x}\text{Sr}_x\text{CuO}_x$  ( $T_c$  40K) and  $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$  ( $T_c$  90K) were discovered in 1987 and have been actively studied since. In spite of an intense world wide research effort during this time a complete understanding of the copper oxide cuprate materials is still lacking. Many fundamental questions are unanswered, particularly the mechanism by which high  $T_c$  superconductivity occurs. More broadly, the cuprates are in a class of solids with strong electron-electron interactions. An understanding of such strongly correlated solids is perhaps the major unsolved problem of condensed matter physics, with over ten thousand researchers working on this topic. High  $T_c$  superconductors also have significant potential for applications in technologies ranging from electric power generation and transmission to digital electronics. This ability to carry large amounts of current can be applied to electric power devices such as motors and generators and to electricity transmission in power lines. For example, superconductors can carry as much as 100 times the amount of electricity of ordinary copper or aluminium wires of the same size. Many universities, research institutes, and companies are working to develop high  $T_c$  superconductivity applications, and considerable progress has been made. This volume brings together new leading edge research in the field.

Klamut, Boyd Veal, Bodgan M. Dabrowski, 2014-01-15 *Advances in Superconductivity XII* T. Yamashita, K.

Tanabe, 2013-11-11 The 12th International Symposium on Superconductivity was held in Morioka, Japan, October 17-19, 1999. Convened annually since 1988, the symposium covers the whole field of superconductivity from fundamental physics and chemistry to a variety of applications. At the 12th Symposium, a mini symposium focusing on the two dimensionality of high temperature superconductors or the  $c$  axis transport and a session on vortex physics were organized. There were also many reports on the recent developments of YBCO based coated conductors both in the United States and in Japan. AC losses of wires and tapes, developments of bulk materials with strong flux pinning, the recent progress in thin film and junction technologies, and the demonstration of various electronics applications using SQUIDS, microwave devices, and single flux quantum (SFQ) digital devices. This volume is a valuable resource for all those working in the field of superconductivity.

**The New Superconducting Electronics** H. Weinstock, Richard W. Ralston, 2012-12-06 This volume is based on the proceedings of the NATO sponsored Advanced Studies Institute ASn on The New Superconducting Electronics held 9-20 August 1992 in Waterville Valley New Hampshire USA The contents herein are intended to provide an update to an earlier volume on the same subject based on a NATO ASI held in 1988 Four years seems a relatively short time interval and our title itself featuring The New Superconducting Electronics may appear somewhat pretentious Nevertheless we feel strongly that the ASI fostered a timely reexamination of the technical progress and application potential of this rapid paced field There are indeed many new avenues for technological innovation which were not envisioned or considered possible four years ago The greatest advances by far have occurred with regard to oxide superconductors the so called high transition temperature superconductors known in short as HTS These advances are mainly in the ability to fabricate both 1 high quality relatively large area films for microwave filters and 2 multilayer device structures principally superconducting normal superconducting SNS Josephson junctions for superconducting quantum

interference device SQUID magnetometers Additionally we have seen the invention and development of the flux flow transistor a planar three terminal device During the earlier ASI only the very first HTS films with adequate critical current density had just been fabricated and these were of limited area and had high resistance for microwave current
