Plant Cell Cultures Results And Perspectives:

Plant Cell Culture in Crop Improvement Kenneth Giles, 2013-11-11 The current and potential importance of plant tissue culture techniques in crop improvement is hard to overemphasize. There are few areas where these techniques will have more possible impact than in tropical agriculture where the availability of high productivity varieties is sadly lacking in many species. The potential for the rapid clonal propagation of elite individuals and the use of controlled multiline planting could have a major effect on crop yield and disease resistance in many areas of the world. This volume is a collection of papers presented at the Conference on Crop Improvement Through Tissue Culture held at the Base Institute Calcutta India in December 1981. It attempts to bring together local research workers familiar with the agricultural resources of the area and tissue culture and molecular level workers. It was the hope of the conference that the cross fertilization of ideas would lead to new approaches and activity in this area. The editors trust that this collection of papers will stimulate interest and research in the tissue culture and improvement of crop plants everywhere. **ACKNOWLEDGEMENTS** The symposium from which the papers in this book are drawn was held at Bose Institute Calcutta on December 6 to December 10 1981.

Primary and Secondary Metabolism of Plant Cell Cultures II Wolfgang G.W. Kurz, 2012-12-06 At the end of the initial meeting on Primary and Secondary Metabolism of Plant Cell Cultures at Schloss Rauischholzhausen it was decided to convene similar events on a regular basis midway between the International Congress for Plant Tissue and Cell Culture. We felt it was necessary to bring representatives of the research teams working in this field together to assess progress as well as to discuss future directions. The Plant Biotechnology Institute of the National Research Council of Canada in Saskatoon Saskatchewan was chosen to be the site for the second symposium held in 1988. The theme of this meeting was The Regulation of Primary and Secondary Metabolism in Plant Cells and judging by the contributions published in this volume it was a timely and actual one indeed. I would like to thank my organizing committee and my research group for their efforts, the National Research Council of Canada for the financial assistance and the participants for their contributions which all contributed to make this symposium a success. A special thank you to Mrs L. Blashill and R. Gallays for their assistance in hosting this event. Last but not least I would like to thank our publisher Springer Verlag Heidelberg for their decision to publish the proceedings of this and future symposia. **Plant Cell and Tissue Culture** Indra K. Vasil, Trevor A.

Thorpe, 1994-06-30 Plant Cell and Tissue Culture gives an exhaustive account of plant cell culture and genetic transformation including detailed chapters on all major field and plantation crops. Part A presents a comprehensive coverage of all necessary laboratory techniques for the initiation, nutrition, maintenance and storage of plant cell and tissue cultures including discussions on these topics as well as on morphogenesis and regeneration, meristem and shoot tip culture, plant protoplasts, mutant cell lines, variation in tissue cultures, isogenic lines, fertilization control, cryopreservation, transformation and the production of secondary metabolites. Part B then proceeds into detail on the specific in vitro culture of specific crops.

Veilleux, 2013-03-09 Since the beginning of agricultural production there has been a continuous effort to grow more and better quality food to feed ever increasing populations Both improved cultural practices and improved crop plants have allowed us to divert more human resources to non agricultural activities while still increasing agricultural production Malthusian population predictions continue to alarm agricultural researchers especially plant breeders to seek new technologies that will continue to allow us to produce more and better food by fewer people on less land Both improvement of existing cultivars and development of new high yielding cultivars are common goals for breeders of all crops In vitro haploid production is among the new technologies that show great promise toward the goal of increasing crop yields by making similar germplasm available for many crops that was used to implement one of the greatest plant breeding success stories of this century i.e. the development of hybrid maize by crosses of inbred lines One of the main applications of anther culture has been to produce diploid homozygous pure lines in a single generation thus saving many generations of backcrossing to reach homozygosity by traditional means or in crops where self pollination is not possible Because doubled haploids are equivalent to inbred lines their value has been appreciated by plant breeders for decades The search for natural haploids and methods to induce them has been ongoing since the beginning of the 20th century **Cell and Tissue Culture Techniques for Cereal Crop Improvement**,

Dodds,2012-12-06 1 John H Dodds The culture offragmen ts of plant tissue is not a particularly new science in fact as long ago as 1893 Rechinger 1893 described the formation of callus on isolated fragments of stems and roots The culture of plant tissues in vitro on a nutrient medium was performed by Haberlandt 1902 however his attempts were unsuccessful because he chose too simple a medium that lacked critical growth factors Over the last fifty years there has been a surge of development in plant tissue culture techniques and a host of techniques are now avail able Dodds and Roberts 1982 The major areas are as follows Callus Culture Callus is a rather ill dermed material but is usually described as an un organised proliferating mass of tissue Although callus cultures have a great deal of potential in the biotechnological aspects of tissue culture i e secondary product formation they are not very suitable for plant propagation The key reason for their unsuitability is that genetic aber rations occur during mitotic divisions in callus growth D amato 1965 The aberrations can be of a major type such as aneuploidy or endo reduplication It follows therefore that the genetic status of the re generated plants is different from that of the parent type In general terms this genetic instability is undesirable but there are occasions when a callus stage can be purposely included to diversify the genetic base of the crop Toxins in Plant Disease R Durbin,2012-12-02 Toxins in Plant Disease presents a comprehensive coverage of plant disease toxins both those for which there are reasonable evidence and those with fewer credentials This book is primarily concerned with the mechanism wherein substances that interfere with metabolism or that alter the normal structure of protoplasm are produced and released category 1 this includes the traditional toxins which are usually of low molecular weight It also describes category 2 mechanism wherein substances that interfere with normal control of growth and development are produced and released these microorganisms are classified as growth affecting compounds Moreover

this text addresses some high molecular weight compounds that contribute to vascular dysfunction It further talks about the production isolation assay genetics of production mechanism of action structure activity relationship metabolism and applications of these toxins This publication will provide a rational basis for future investigations and contribute to the eventual understanding of the role that toxins play in disease causation **Cell Physiology and Genetics of Higher**

Fowler,G.S. Warren,Murray Moo-Young,2013-10-22 Today it is generally accepted that one of the key areas of biotechnology for the next century will be in plant based biotechnology Biotechnology has created new opportunities for plant scientists with important applications to agriculture and forestry This reference text is divided into five sections for ease of presentation The first section focuses on the structure composition and functionality of plant cells and genes with particular emphasis on the cellular and molecular biology of plants and cultured cells Section two is concerned with the direct exploitation of cell cultures for the production of useful substances The third section deals with regeneration and propagation

systems The fourth section considers the increasingly central area of genetic manipulation of plant cell systems The last section is on specific applications in plant biotechnology This reference work is a survey of these various facets of plant biotechnology The individual chapters and the follow up literature cited allow an easy access to the various subject areas and will hopefully stimulate interest in these rapidly moving and exciting fields of research

In Vitro Culture of Trees J.M. Bonga, Patrick Aderkas, 2013-06-29 Woody plants provide many challenges to the tissue culturist Although there are many excellent tissue culture books and manuals available these are generally strongly biased towards herbacious crops Consequently they often do not pay sufficient attention to the problems that specifically apply to in vitro culture of tree species Culture of the latter often poses problems which are either absent or of lesser significance when culturing herbacious species When trees in the field are used as explant source the problems can be especially severe For example the physiological condition of the explants is difficult to control because of variation in weather and biotic factors Furthermore it is often difficult to obtain explants free of contaminants from field grown trees Lack of genetic uniformity and maturation are additional problems one often has to deal with when culturing tree cells or tissues These problems are emphasized in this text In vitro culture of trees is not viewed in isolation It is considered in conjunction with breeding traditional cloning and other common tree improvement techniques The text discusses theoretical as well as practical aspects of the in vitro culture of trees

Applications of Genetic Engineering to Crop Improvement G.B. Collins, Joseph F. Petolino, 2012-12-06 The contributions of plant genetics to the production of higher yielding crops of superior quality are well documented These successes have been realized through the application of plant breeding techniques to a diverse array of genetically controlled traits Such highly

effective breeding procedures will continue to be the primary method employed for the development of new crop cultivars however new techniques in cell and molecular biology will provide additional approaches for genetic modification There has been considerable speculation recently concerning the potential impact of new techniques in cell and molecular biology on plant improvement These genetic engineering techniques should offer unique opportunities to alter the genetic makeup of crops if applied to existing breeding procedures Many questions must be answered in order to identify specific applications of these new technologies This search for applications will require input from plant scientists working on various aspects of crop improvement This volume is intended to assess the interrelationships between conventional plant breeding and genetic engineering
