Recent Advances in Plant Biotechnology Ara Kirakosyan, Peter B. Kaufman, 2009-08-15 Plant biotechnology applies to three major areas of plants and their uses 1 control of plant growth and development 2 protection of plants against biotic and abiotic stresses and 3 expansion of ways by which specialty foods biochemicals and pharmaceuticals are produced The topic of recent advances in plant biotechnology is ripe for consideration because of the rapid developments in this field that have revolutionized our concepts of sustainable food production cost effective alternative energy strategies environmental bioremediation and production of plant derived medicines through plant cell biotechnology Many of the more traditional approaches to plant biotechnology are woefully out of date and even obsolete Fresh approaches are therefore required To this end we have brought together a group of contributors who address the most recent advances in plant biotechnology and what they mean for human progress and hopefully a more sustainable future Achievements today in plant biotechnology have already surpassed all previous expectations These are based on promising accomplishments in the last several decades and the fact that plant biotechnology has emerged as an exciting area of research by creating unprecedented opportunities for the manipulation of biological systems In connection with its recent advances plant biotechnology now allows for the transfer of a greater variety of genetic information in a more precise controlled manner The potential for improving plant productivity and its proper use in agriculture relies largely on newly developed DNA biotechnology and molecular markers
