Life Cycle Engineering of Plastics L. Lundquist, Y. Leterrier, P. Sunderland, J.A.E. Manson, 2001-01-23 This book adds much to the already evolving field of Design for Environment but it goes far beyond most works on this subject by surrounding the central notions of life cycle assessment with a scientific body of knowledge and with a more practical slant reflecting the reality of the organizations in which product development occurs Through a focus on plastic products the

authors show the importance of making ties between basic technical knowledge and the process of life cycle engineering. Their approach offers a practical deliberate way to make ecologically and economically sensible decisions about product reuse and recycling and other critical dimensions of product life behavior. They demonstrate a positive approach to designing products that fits into a sustainable economy through down to earth cases. While the book focuses on the life cycle engineering of plastics it is only a short step to other materials and products. Beyond contributing to the technology of life cycle engineering this text adds to the growing body of knowledge that argues for a fundamentally new way of thinking about economic and social activity a new paradigm for sustainable social and industrial problem solving. Industrial ecology is such a new system for thinking about and implementing sustainability that draws its core set of ideas from the ecological world. Industrial ecology brings to the surface the idea of interdependence among members of a community natural or economic and notes the material cycles that are central to a stable ecosystem. The life cycle engineering framework coupled with sound scientific knowledge of materials behavior as articulated in this book makes a giant step towards bringing the model of industrial ecology into everyday practice.
