Machine Learning Vol 4 A Multistrategy Approach:

Machine Learning Ryszard S. Michalski, George Tecuci, 1994-02-09 Multistrategy learning is one of the newest and most promising research directions in the development of machine learning systems. The objectives of research in this area are to study trade offs between different learning strategies and to develop learning systems that employ multiple types of inference or computational paradigms in a learning process. Multistrategy systems offer significant advantages over monostrategy systems. They are more flexible in the type of input they can learn from and the type of knowledge they can acquire. As a consequence multistrategy systems have the potential to be applicable to a wide range of practical problems. This volume is the first book in this fast growing field. It contains a selection of contributions by leading researchers specializing in this area. See below for earlier volumes in the series.

Encyclopedia of Microcomputers Allen Kent, James G. Williams, 2024-11-01 The Encyclopedia of Microcomputers serves as the ideal companion reference to the popular Encyclopedia of Computer Science and Technology. Now in its 10th year of publication this timely reference work details the broad spectrum of microcomputer technology including microcomputer history, explains and illustrates the use of microcomputers throughout academe, business, government and society in general and assesses the future impact of this rapidly changing technology.

Goal-driven Learning Ashwin Ram, David B. Leake, 1995 Brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process. In cognitive science, artificial intelligence, psychology and education a growing body of research supports the view that the learning process is strongly influenced by the learner's goals. The fundamental tenet of goal driven learning is that learning is largely an active and strategic process in which the learner (human or machine) attempts to identify and satisfy its information needs in the context of its tasks and goals, its prior knowledge, its capabilities and environmental opportunities for learning. This book brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process. It collects and solidifies existing results on this important issue in machine and human learning and presents a theoretical framework for future investigations. The book opens with an overview of goal driven learning research and computational and cognitive models of the goal driven learning process. This introduction is followed by a collection of fourteen recent research articles addressing fundamental issues of the field including psychological and functional arguments for modeling learning as a deliberative, planful process; experimental evaluation of the benefits of utility based analysis to guide decisions about what to learn; case studies of computational models in which learning is driven by reasoning about learning goals; psychological evidence for human goal driven learning; and the ramifications of goal driven learning in educational contexts. The second part of the book presents six position papers reflecting ongoing research and current issues in goal driven learning. Issues discussed include methods for pursuing psychological studies of goal driven learning frameworks for the design of active and multistrategy learning systems and

Intelligent Technologies--theory and Applications Peter Sincak,2002

Annotation Intelligent Technologies including neural network evolutionary computations fuzzy approach and mainly hybrid approaches are very promising tools to build intelligent technologies in general The progress of each theory or application is provided by a number of various theoretical as well as applicational experiments Machine intelligence is the only alternative how to increase the level of technology to make technology more human centred and more effective for society This book includes theoretical as well as applicational papers in the field of neural networks fuzzy systems and mainly evolutionary computations which application potential was increased by enormous progress in computer power Hybrid technologies are still progressing and are trying to make some more applications with their ability to learn and process fuzzy information Neurogenetic systems are very interesting approach to make systems re configurable and on line systems for real world applications The book is presenting papers from Japan USA Hungary Poland Germany Finland France Slovakia United Kingdom Czech Republic and some other countries This publication provides the latest state of the art in the field and could be contributed to theory and applications in the machine intelligence tools and their wide application potential in current and future technologies within the Information Society

Building Intelligent Agents Gheorghe Tecuci,1998-06-23

Building Intelligent Agents is unique in its comprehensive coverage of the subject The first part of the book presents an original theory for building intelligent agents and a methodology and tool that implement the theory The second part of the book presents complex and detailed case studies of building different types of agents an educational assessment agent a statistical analysis assessment and support agent an engineering design assistant and a virtual military commander Also featured in this book is Disciple a toolkit for building interactive agents which function in much the same way as a human apprentice Disciple based agents can reason both with incomplete information but also with information that is potentially incorrect This approach in which the agent learns its behavior from its teacher integrates many machine learning and knowledge acquisition techniques taking advantage of their complementary strengths to compensate for each others weakness As a consequence it significantly reduces or even eliminates the involvement of a knowledge engineer in the process of building an intelligent agent

Data Mining, Southeast Asia Edition Jiawei Han,Jian Pei,Micheline Kamber,2006-04-06 Our ability to

generate and collect data has been increasing rapidly Not only are all of our business scientific and government transactions now computerized but the widespread use of digital cameras publication tools and bar codes also generate data On the collection side scanned text and image platforms satellite remote sensing systems and the World Wide Web have flooded us with a tremendous amount of data This explosive growth has generated an even more urgent need for new techniques and automated tools that can help us transform this data into useful information and knowledge Like the first edition voted the most popular data mining book by KD Nuggets readers this book explores concepts and techniques for the discovery of patterns hidden in large data sets focusing on issues relating to their feasibility usefulness effectiveness and scalability However since the publication of the first edition great progress has been made in the development of new data mining methods systems and applications This new edition substantially enhances the first edition and new chapters have been added to address recent developments on mining complex types of data including stream data sequence data graph structured data social network data and multi relational data A comprehensive practical look at the concepts and techniques you need to know to get the most out of real business data Updates that incorporate input from readers changes in the field and more material on statistics and machine learning Dozens of algorithms and implementation examples all in easily understood pseudo code and suitable for use in real world large scale data mining projects Complete classroom support for instructors at www.mkp.com/datamining2e companion site **Basic Concepts of Data Mining** Monelli

Ayyavaraiah,2017-01-01 The field of data mining has seen rapid strides over the past two decades especially from the perspective of the computer science community While data analysis has been studied extensively in the conventional field of probability and statistics data mining is a term coined by the computer science oriented community For computer scientists issues such as scalability usability and computational implementation are extremely important The emergence of data science as a discipline requires the development of a book that goes beyond the traditional focus of books on only the fundamental data mining courses Recent years have seen the emergence of the job description of data scientists who try to glean knowledge from vast amounts of data In typical applications the data types are so heterogeneous and diverse that the fundamental methods discussed for a multidimensional data type may not be effective Therefore more emphasis needs to be placed on the different data types and the applications which arise in the context of these different data types A comprehensive data mining book must explore the different aspects of data mining starting from the fundamentals and then explore the complex data types and their relationships with the fundamental techniques While fundamental techniques form an excellent basis for the further study of data mining they do not provide a complete picture of the true complexity of data analysis This book studies these advanced topics without compromising the presentation of fundamental methods Therefore this book may be used for both introductory and advanced data mining courses Until now no single book has addressed all these topics in a comprehensive and integrated way **Understanding Language Understanding** Ashwin Ram,Kenneth

Moorman,1999 This book highlights cutting edge research relevant to the building of a computational model of reading comprehension as in the processing and understanding of a natural language text or story The book takes an interdisciplinary approach to the study of reading with contributions from computer science psychology and philosophy Contributors cover the theoretical and psychological foundations of the research in discussions of what it means to understand a text how one builds a computational model and related issues in knowledge representation and reasoning The book also addresses some of the broader issues that a natural language system must deal with such as reading in context linguistic novelty and information extraction

Computational Architectures Integrating Neural and Symbolic Processes

Ron Sun,Lawrence A. Bookman,2007-08-19 Computational Architectures Integrating Neural and Symbolic Processes A Perspective on the State of the Art focuses on a currently emerging body of research With the reemergence of neural networks in the 1980s with their emphasis on overcoming some of the limitations of symbolic AI there is clearly a need to support some form of high level symbolic processing in connectionist networks As argued by many researchers on both the symbolic AI and connectionist sides many cognitive tasks e g language understanding and common sense reasoning seem to require high level symbolic capabilities How these capabilities are realized in connectionist networks is a difficult question and it constitutes the focus of this book Computational Architectures Integrating Neural and Symbolic Processes addresses the underlying architectural aspects of the integration of neural and symbolic processes In order to provide a basis for a deeper understanding of existing divergent approaches and provide insight for further developments in this field this book presents 1 an examination of specific architectures grouped together according to their approaches their strengths and weaknesses why they work and what they predict and 2 a critique comparison of these approaches Computational Architectures Integrating Neural and Symbolic Processes is of interest to researchers graduate students and interested laymen in areas such as cognitive science artificial intelligence computer science cognitive psychology and neurocomputing in keeping up to date with the newest research trends It is a comprehensive in depth introduction to this new emerging field

Towards Very Large Knowledge Bases

N. J. I. Mars,1995 In the early days of artificial intelligence it was widely believed that powerful computers would in the future enable mankind to solve many real world problems through the use of very general inference procedures and very little domain specific knowledge With the benefit of hindsight this view can now be called quite naive The field of expert systems which developed during the early 1970s embraced the paradigm that Knowledge is Power even very fast computers require very large amounts of very specific knowledge to solve non trivial problems Thus the field of large knowledge bases has emerged
