environment Panbiogeography describes a new synthesis of sciences of plant and animal distribution The book emphasizes that the geographical patterns of animal and plant distribution contribute directly to the understanding and interpretation of evolutionary history Geographic location is reintroduced as a critical element of both biogeography and evolutionary biology The authors present chapters exploring the roles of geology ecology evolution in panbiogeographic theory and introduce new methods modes of classification and ways of measuring biodiversity

**Renegotiating Disciplinary Fields in the Life Sciences** Alessandro Minelli, 2021-02-24 Recent and ongoing debates in biology and the philosophy of biology reveal a widespread dissatisfaction with traditional explanatory frameworks There are also problems with the current definitions or circumscriptions of key concepts such as gene species and homology and even of whole disciplinary fields within the life sciences e g developmental biology These contrasting views are arguably a symptom of the need to revisit traditional unchallenged partitions between the specialist disciplines within the life sciences In the diversity of topics addressed and approaches to move beyond the current disciplinary organization the five essays in this volume will hopefully stimulate further exploration towards an improved articulation of life sciences

*Promoting the Conservation and Use of Plant Genetic Resources by Training and Research* Peter M. A. Tigerstedt, 2002 Biological Systematics Alessandro Minelli, 2012-12-06 To some potential readers of this book the description of Biological Systematics as an art may seem outdated and frankly wrong For most people art is subjective and unconstrained by universal laws While one picture play or poem may be internally consistent comparison between different art products is meaningless except by way of the individual artists On the other hand modern Biological Systematics particularly phenetics and cladistics is offered as objective and ultimately governed by universal laws This implies that classifications of different groups of organisms being the products of systematics should be comparable irrespective of authorship Throughout this book Minelli justifies his title by developing the theme that biological classifications are in fact very unequal in their expressions of the pattern and processes of the natural world Specialists are imbibed with their own groups and tend to establish a consensus of what constitutes a species or a genus or whether it should be desirable to recognize sub species cultivars etc Ornithologists freely recognize subspecies and rarely do bird genera contain more than 10 species On the other hand some coleopterists and botanists work with genera with over 1500 species This asymmetry may reflect a biological reality it may express a working practicality or simply an historical artefact older erected genera often contain more species Rarely are these phenomena questioned

**Genetic Resources of Mediterranean Pasture and Forage Legumes** Sarita Jane Bennett, P.S. Cocks, 2012-12-06 Genetic Resources of Mediterranean Pasture and Forage Legumes is a comprehensive review of grassland improvement in Mediterranean areas using legume species The book includes a detailed account of the processes involved in understanding the ecology of legumes and their collection in the Mediterranean through to their preliminary evaluation and storage at various Genetic Resource Centres A generic conspectus and key to the forage legumes of the Mediterranean basin is also included These proceedings are truly international with examples on the collection and use of Mediterranean genetic resources being illustrated by Genetic Resource Centres in Australia Cyprus France Greece Syria Turkey and Tunisia Current important issues such as the sustainability of Mediterranean grasslands the risk of genetic erosion and the principles of population genetics employed during a collecting mission are discussed The book will be of value to researchers working in the fields of grassland and rangeland improvement Mediterranean farming systems genetic resources and pasture and forage ecology

*Gene Flow from GM Plants* Guy M. Poppy, Michael J. Wilkinson, 2008-04-15 Gene flow is not unique to genetically modified GM crops but the possibility of the spread of transgenic DNA to wild and domesticated relatives raises a new set of issues for scientists and policymakers to consider Unfortunately we are still too often unable to quantify the risks of ecological damage associated with gene flow This is due partly to the huge breadth of knowledge required to assemble a comprehensive risk assessment For example many scientists active in research on the mechanics of gene flow nevertheless lack a deep understanding of what is required to identify characterise and assess ecological risk and many of those who are aware of the risk assessment process and the framework

used for legislation have insufficient knowledge of the reproductive biology agricultural systems modelling and ecological literature required to compile a balanced risk assessment This book set in the context of gene flow in general considers the assessment measurement and management of the risks of gene flow from GM plants combining the expertise of all the various stakeholders It is directed at researchers and professionals in plant molecular genetics and plant ecology in both the academic and industrial sectors
