International Encyclopedia of Transportation, 2021-05-13 In an increasingly globalised world despite reductions in costs and time, transportation has become even more important as a facilitator of economic and human interaction. This is reflected in technical advances in transportation systems, increasing interest in how transportation interacts with society and the need to provide novel approaches to understanding its impacts. This has become particularly acute with the impact that Covid 19 has had on transportation across the world at local, national and international levels. Encyclopedia of Transportation, Seven Volume Set containing almost 600 articles brings a cross-cutting and integrated approach to all aspects of transportation from a variety of interdisciplinary fields including engineering, operations research, economics, geography and sociology in order to understand the changes taking place. Emphasising the interaction between these different aspects of research, it offers new solutions to modern-day problems related to transportation. Each of its nine sections is based around familiar themes but brings together the views of experts from different disciplinary perspectives. Each section is edited by a subject expert who has commissioned articles from a range of authors representing different disciplines, different parts of the world and different social perspectives. The nine sections are structured around the following themes: Transport Modes, Freight Transport and Logistics, Transport Safety and Security, Transport Economics, Traffic Management, Transport Modelling and Data Management, Transport Policy and Planning, Transport Psychology, Sustainability and Health Issues in Transportation. Some articles provide a technical introduction to a topic whilst others provide a bridge between topics or a more future-oriented view of new research areas or challenges. The end result is a reference work that offers researchers and practitioners new approaches, new ways of thinking and novel solutions to problems. All encompassing and expertly authored, this outstanding reference work will be essential reading for all students and researchers interested in transportation and its global impact in what is a very uncertain world. Provides a forward-looking and integrated approach to transportation. Updated with future technological impacts such as self-driving vehicles, cyber-physical systems and big data analytics. Systems, Decision and Control in Energy VI Vitalii Babak, Artur Zaporozhets, 2024-09-21 In an era marked by escalating energy demands and imperatives of environmental stewardship, this compendium serves as a comprehensive exploration of the multifaceted dimensions shaping contemporary

energy development with a focal lens on the symbiotic relationship between energy information and transportation systems. The canvas of 2023's energy evolution is painted against the backdrop of heightened consciousness surrounding climate change and environmental degradation. This epoch witnesses an unyielding momentum toward sustainability catalyzed by a profound shift in energy sourcing paradigms. Renewable energy sources—solar, wind, hydro, and beyond—attain unprecedented prominence not merely as alternative energy options but as linchpins of a redefined energy matrix fostered by advancements in technology, economics, and scalability. At the nexus of this transformative energy landscape lies the realm of Energy Informatics, a domain where information technologies converge with energy systems. Smart grids, IoT-enabled devices, data analytics, and artificial intelligence orchestrate a symphony of efficiency and optimization, revolutionizing energy management, demand response dynamics, and grid resilience. The fusion of information technology and energy infrastructures stands poised to usher in an era of unprecedented interconnectivity and adaptability. Transportation, an indispensable facet of the energy ecosystem, undergoes a metamorphosis in 2023. Electrification, hydrogen-powered vehicles, and advancements in sustainable fuels reimagine mobility paradigms, heralding a transition toward greener, more efficient transportation systems. The synergy between energy and transportation, facilitated by data-driven insights and technological innovations, propels the convergence of these domains toward a more sustainable future. Moreover, the global socio-political landscape assumes paramount significance in shaping the contours of energy dynamics. Geopolitical considerations, international collaborations, and policy frameworks delineate the trajectory of energy infrastructure investments, trade patterns, and the realization of sustainable energy transitions on a global scale. Yet, within the narrative of progress, challenges persist. Legacy infrastructures, regulatory complexities, socio-economic disparities, and the imperative of inclusive transitions underscore the complexities inherent in reshaping the energy and transportation landscapes.

Contemporary Ideas on Ship Stability Vadim L.

Belenky, Kostas J., Spyrou, Frans van Walree, Marcelo Almeida Santos Neves, Naoya Umeda, 2019-01-01. This book contains a selection of research papers presented at the 11th and 12th International Ship Stability Workshops (Wageningen 2010 and Washington DC 2011) and the 11th International Conference on Stability of Ships and Ocean Vehicles (Athens 2012). The book is directed toward the ship stability community and presents innovative ideas concerning the understanding of the physical nature of stability failures and methodologies for assessing ship stability. Particular interest of the readership is expected in relation with appearance of new and unconventional types of ships; assessment of stability of these ships cannot rely on the existing experience and has to be based on the first principles. As the complexity of the physical processes responsible for stability failure have increasingly made time domain numerical simulation the main tool for stability assessment, particular emphasis is made on the development and application of such tools. The included papers have been selected by the editorial committee and have gone through an additional review process with at least two reviewers allocated for each. Many of the papers have been significantly updated or expanded from their original version in order to best reflect the state of knowledge.

concerning stability at the time of the book's publication. The book consists of four parts: Mathematical Model of Ship Motions in Waves, Dynamics of Large Motions, Experimental Research, and Requirements, Regulations, and Operations.
