Keoleian,1994-12-31 Life cycle design is a proactive approach for integrating pollution prevention and resource conservation strategies into the development of more ecologically and economically sustainable product systems Cross media pollutant transfer and the shifting of other impacts can be avoided by addressing the entire life cycle which includes raw materials acquisition materials processing manufacturing and assembly use and service retirement disposal and the ultimate fate of residuals The goal of life cycle design is to minimize aggregate risks and impacts over this life cycle This goal can only be attained through the balancing of environmental performance cost cultural legal and technical requirements of the product system Concepts such as concurrent design total quality management cross disciplinary teams and multi attribute decision making are essential elements of life cycle design that help meet these goals The framework for life cycle design was developed to be applicable for all product domains It was written to assist not only design professionals but all other constituents who have an important role in life cycle design including corporate executives product managers production workers distributors environmental health and safety staff purchasers accountants marketers salespersons legal staff consumers and government regulators A coordinated effort is required to institute changes needed for successful implementation of life cycle design Part I seeks to promote the reduction of environmental impacts and health risks through a systems approach to design The approach is based on the product life cycle which includes raw materials acquisition and processing manufacturing use service resource recovery and disposal A life cycle design framework was developed to provide guidance for more effectively conserving resources and energy preventing pollution and reducing the aggregate environmental impacts and health risks associated with a product system This framework addresses the product process distribution and management information components of each product system Part II describes the three components of a life cycle assessment inventory analysis impact analysis and improvement analysis as well as scoping activities presents a brief overview of the development of the life cycle assessment process and develops guidelines and principles for implementation of a product life cycle assessment The major states in a life cycle are raw materials acquisition

manufacturing consumer use reuse maintenance and recycle waste management The basic steps of performing a life cycle inventory defining the goals and system boundaries including scoping gathering and developing data presenting and reviewing data and interpreting and communicating results are presented along with the general issues to be addressed The system boundaries assumptions and conventions to be addressed in each stage of the inventory are presented **Risk Analysis and Reduction in the Chemical Process Industry** J.M. Santamaría Ramiro,P.A. Braña Aísa,2012-12-06 Concern for the environment has become one of the big issues in modern society and one of the chief concerns is the environmental impact of modern industrial production A particularly sensitive issue is the possibility of accidents in industries where there may be severe consequences for people property and the environment At one time the nuclear industry was seen as the most likely to be the cause of significant environmental damage but after the occurrence of several major accidents such as Seveso Flixborough and Bhopal that concern extends to much of the chemicals industry Pressure from society reflected by strong legislation coupled with a greater understanding of the impact that chemical processing operations can have has led to the adoption of higher profile safety and environmental management programs within the chemical industry Under these programmes existing and new processes are rigorously examined to determine the possible causes and consequences of failure and the results used to improve the process to make failure less likely Any process audit aimed at improving safety or lessening the environmental impact cannot be carried out using intuition or experience alone so the discipline of risk analysis has grown as a collection of tools and methods which can be utilized to give a quantitative assessment of the risks involved in operating any given process In this new book the authors present risk analysis and reduction in a clear and unified way emphasizing the various different methods which can be used together in a global approach to risk analysis in the chemical process industries Originally conceived as a text book for graduate level courses in chemical engineering the clear presentation and thorough coverage will ensure that anyone involved in risk assessment environmental impact assessment or safety planning will find this book an invaluable source of reference Lees' Loss Prevention in the Process Industries Frank Lees,2012-11-05 Safety in the process industries is critical for those who work with chemicals and hazardous substances or processes The field of loss prevention is and continues to be of supreme importance to countless companies municipalities and governments around the world and Lees is a detailed reference to defending against hazards Recognized as the standard work for chemical and process engineering safety professionals it provides the most complete collection of information on the theory practice design elements equipment regulations and laws covering the field of process safety An entire library of alternative books and cross referencing systems would be needed to replace or improve upon it but everything of importance to safety professionals engineers and managers can be found in this all encompassing three volume reference instead The process safety encyclopedia trusted worldwide for over 30 years Now available in print and online to aid searchability and portability Over 3 600 print pages cover the full scope of process safety and loss prevention compiling
