Molecular Mechanisms of Membrane Fusion Shinpei Ohki, 2012-12-06 Membrane fusion is an important molecular event which plays a pivotal role in many dynamic cellular processes such as exocytosis endocytosis membrane biogenesis fertilization etc While many reports on the physico chemical process involved

in membrane fusion have appeared in the literature and much information has accumulated there has been no comprehensive meeting of workers in the field A recent symposium which took place at the Center for Tomorrow State University of New York at Buffalo New York April 27-29 1987 was the first meeting of its kind to specifically address the molecular mechanisms of membrane fusion The Symposium consisted of oral workshop and poster presentation sessions The papers presented in the oral and workshop sessions are collected here and arranged approximately in the order presented at the Symposium These papers are the most up to date and representative work at the forefront of each aspect of membrane fusion Although the readers may find some differences in interpretations regarding the molecular mechanisms of membrane fusion there is an overall consensus that increased hydrophobicity and dehydration of the membrane surface are essential physicochemical factors for membrane fusion to occur We trust that these papers will contribute to your further understanding of the mechanisms of membrane fusion

Membrane Fusion, 2011-07-25 This volume of Current Topics in Membranes focuses on Membrane Fusion beginning with fusion and fission of lipid bilayers with reviews focused on hemifusion and dynamic remodeling of membranes catalyzed by dynamin Other topics discussed include viral fusion intracellular fusion developmental cell fusion and theoretical modeling

Methods in Membrane Biology Edward D. Korn, 2012-12-06 Three articles make up Volume 10 of Methods in Membrane Biology In the first of these Papahadjopoulos Poste and Vail extensively review much of the available data on the fusion of natural membranes model membranes liposomes and natural membranes with liposomes The authors are led by their review of the experimental methods and their interpretations of the results obtained to a general theory of membrane fusion which they believe is applicable to all systems that have been studied Arguing that although protein and carbohydrate may serve in some cases to bring membranes into sufficiently close proximity for fusion to occur and in other cases to remove peripheral and integral proteins from the regions that are to undergo fusion the authors conclude that membrane fusion per se is solely a property of the lipid bilayer In their view all the experimental observations to date can be subsumed under a unifying hypothesis in which membrane fusion is the result of a phase separation in one half of the membrane bilayer brought about by the interaction of calcium ions with acidic phospholipids mostly phosphatidylserine Where half membranes already contain sufficient acidic phospholipids a local increase in calcium ion concentration may suffice to induce fusion examples might include exocytosis and fusion of intracellular membrane systems In other cases natural or experimentally induced events preceding fusion might be necessary to increase the local concentration of the acidic phospholipids in the half membrane virus or fusogenic agent induced cell to cell fusion or endocytosis for example

Dynamics and Biogenesis of Membranes Josef A.F. Op den Kamp, 2013-06-29 Membrane proteins lipids and their glycosylated derivatives are discussed both with respect to their biosynthesis as well as regarding their mutual interaction and assembly into functional membranes Topics cover a large variety of systems and cells investigation on virus membranes as well as pro and eukaryotic cells are

included *Techniques for the Analysis of Membrane Proteins* C. Ragan, 2012-12-06 A preface should justify the existence of the book it precedes and this is invariably done in scientific texts by reference to the explosive growth of the field since the last such volume appeared In molecular biology most fields can be justifiably described as growing explosively as should be the case for a young and vigorous science but the study of membrane proteins stands out as one which has taken giant strides in the last few years Ignorance of the structure and function of membrane proteins at the molecular level was certainly not due to lack of interest but rather was a result of lack of appropriate techniques It has above all been the development of new experimental methods which has wrenched membrane biochemistry out of what Anthony Martonosi fetchingly called its romantic phase Le lots of ideas and few facts into an era when the determination of membrane protein structure and mechanism is a reasonable goal Membrane proteins are generally classified as peripheral or integral Peripheral proteins are relatively easily dissociated from membranes by mild treatments whence their study is essentially no different to that of soluble proteins This book therefore concentrates on integral proteins which are strongly bound to the membrane by hydrophobic interactions with lipids A crucial step in their study is of necessity the development of methods of solubilization and purification under non denaturing conditions Structure of Biological Membranes Sixten Abrahamsson, 2013-03-08 Since 1965 the Nobel Foundation sponsors through grants from the Bank of Sweden Tercentenary Fund Sym posia on subjects which are considered to be of central scientific importance and for which new results of a special interest have been reached The aim of these Symposia is to bring together by personal invitation a limited number of leading scientists from various countries to discuss the current research situation within the field and to define the most urgent problems to be solved One of the most important fields in modern biome dical research concerns the structure and function of biological membranes Research on this subject is very active and important scientific contributions appear at an increasing rate It was therefore considered highly appropriate to devote Nobel Symposium 34 to the struc ture of membranes in order to get an expert summary of what is now known in the field The Symposium was held at Hotel Billinge hus in Skovde about 150 km from Goteborg Sweden from June 7 to 11 1976 In addition to the grant from the Nobel Foundation financial support was received from the No bel Institute of Chemistry of the Royal Academy of Sciences and from the Science Fund of Wilhelm and Martina Lundgren The Symposium was attended by some 50 scientists The papers in this Volume had been distributed in ad vance to all partiCipants Therefore only summary pre sentations needed be given at the Symposium and the main emphasis was put on discussions
