

Equipment

Overflow Cans

A beaker, large pitcher, or measuring cup with a pouring lip may be substituted for the overflow can.

Model Cars

Model cars can be purchased from many different stores. But for this lab activity to work, the models need to be scale models of actual car models. While scale models are generally more expensive than generic toy cars, they are still relatively inexpensive.

Schiehallion Experiment

Technically, the British experiment in the 1770s (named for the mountain where it was carried out) estimated the density of the earth. But since a fairly accurate estimate of the volume of the earth had been known since the time of the ancient Greeks, calculating the earth's mass after the density was calculated would have been a matter of simple arithmetic.

Scale

Depending on students' math background, you may need to discuss the concept of scale in more detail than is presented here. If your students used *BJU Press Exam Science* 5th Edition last year, you may want to remind them of map scales (see Chapter 3, page 53).

Reading a Graduated Cylinder

Correctly reading a graduated cylinder is an important laboratory skill. If students are unfamiliar with the proper way to read the cylinder's scale, refer them to Appendix D of the Student Lab Manual.

PROCEDURE

Modeling a Car

As you collect data, use the appropriate rows of Tables 1, 2, and 3 to record your data.

- Obtain three model cars and record the type of each in Tables 1, 2, and 3.
- Use the ruler to measure the length of each model. Since actual cars are more consistently measured in meters, not centimeters, convert your lengths to meters. Record these lengths in Table 1.
- On some models on the car tops of your models, enter the lengths of these vehicles in Table 1. Also find the actual masses of these vehicles and record the data in Table 3.
- Calculate the scale of each model using the formula below. Enter your scales in Table 1.

$$\text{scale} = \left(\frac{\text{length}_{\text{actual}}}{\text{length}_{\text{model}}} \right)$$

Determining the Volume

Now that you know the scale of each of your models, you need to find out how much space each one occupies. This property of matter is called its volume. Because a car is rarely shaped like a cube, it's difficult to find its volume by measuring it. Instead, you will use the displacement method to find your models' volumes.

- Fill the overflow can nearly full with water. You will need to tilt the can so that the graduated cylinder can be placed below the overflow spout.
- Using the paper cup, very carefully add water to the overflow can until it begins flowing from the spout. (Consider having another container in place to catch the excess water.)
- Attach a length of thread to one of the car models.
- Hold the graduated cylinder under the overflow can's spout so that it will catch the overflow.
- Gently lower the model into the overflow can, catching the overflow in the graduated cylinder. When the model is fully submerged and the water has stopped flowing, remove the model from the overflow can and place the graduated cylinder on the table.
- Measure the volume of water in the graduated cylinder. Record the volume in Table 2. Empty the graduated cylinder.
