French, Olav Slaymaker, 1993 Low temperatures wind chill snow sea ice and permafrost have been primary characteristics of Canada's northern and alpine environments during the past two million years The evolution of Canada's cultural landscapes the processes of settlement of rural areas and the present interaction of Canadian industrial society with its biophysical environment are all deeply influenced directly or indirectly by the frigidity of the greater part of the country The phenomenon of global warming if it occurs will lessen this coldness but its impact on temperature extremes sea ice regimes vegetation snow distribution permafrost glaciers lakes rivers and mountain hazards are all the subject of intensive research the highlights of which are reviewed in Canada's Cold Environments Eleven of Canada's leading geographers geologists and ecologists provide an authoritative yet readable scientific statement about the physical nature of Canada's coldness They focus on the distinctive attributes of Canada's cold environments their temporal and spatial variability and the constraints that coldness places on human activity The book is aimed at environmental scientists at all levels who need informed overviews of the substantive findings on a range of cold related topics **Landscapes and Landforms of Eastern Canada** Olav Slaymaker, Norm Catto, 2020-02-13 This critical book focuses on the geomorphological landscapes of eastern Canada and provides a companion volume to Landscapes and Landforms of Western Canada 2017 There are a number of unique characteristics of eastern Canada's landscapes notably its magnificent coastlines the extraordinary variety and extent of wetlands the huge Great Lakes St Lawrence basin the high incidence of meteorite craters the spectacular Niagara Falls urban karst in Montreal and Ottawa youthful glaciated karst in Ontario Newfoundland Quebec and Nova Scotia the ubiquitous permafrost terrain of Nunavut Labrador and northern Quebec and the magnificent arctic fjords and glaciers Looking at coastlines the tidal extremes of the Bay of Fundy are world renowned the structural complexity of the island of

Newfoundland is less well known but produces an astounding variety of coastlines in close succession the arctic fjordlands of Baffin and Ellesmere islands and the extravagant raised beaches of Hudson Bay bear comparison with the classic fjords of Norway and the Baltic Sea raised beaches As for wetlands there are distinctive Arctic Subarctic Boreal Eastern Temperate and Atlantic wetlands and their extent is second only to those of Russia In the Hudson and James Bay regions between 75 100% of the terrestrial surface is comprised of wetlands One of North America s largest river basins the Great Lakes St Lawrence basin has its source in Minnesota straddles the USA Canada border and debouches into Quebec as the St Lawrence River and evolves through its estuary into the Gulf of St Lawrence a journey of almost 5 000 km As far as meteorite craters are concerned 10% of the world s total are located in eastern Canada including some of the largest and most complex landforms They are preserved preferentially in the ancient Shield terrain of Quebec Finally the three million km² of permafrost controlled relief in eastern Canada serves as a reminder of the vulnerability of eastern Canada s landscapes to climate change Effects of warming are expressed through thawing of the permafrost disruption of transportation corridors and urban construction problems ever present geomorphic hazards
