Quasiabelian Categories And Sheaves:

Quasi-abelian Categories and Sheaves Jean-Pierre Schneiders, 1999 This memoir is divided in three parts in the first one we introduce the notion of quasi abelian category and link the homological algebra of these categories to that of their abelian envelopes Note that quasi abelian categories form a special class of non abelian additive categories which contains in particular the category of locally convex topological vector spaces and the category of filtered abelian groups In the second part we define what we mean by an elementary quasi abelian category and show that sheaves with values in such a category can be manipulated almost as easily as sheaves of abelian groups In particular we establish that the Poincare Verdier duality and the projection formula hold in this context The third part is devoted to an application of the results obtained to the cases of filtered and topological sheaves

Categories and Sheaves Masaki Kashiwara, Pierre Schapira, 2005-10-20 Categories and sheaves appear almost frequently in contemporary advanced mathematics This book covers categories homological algebra and sheaves in a systematic manner starting from scratch and continuing with full proofs to the most recent results in the literature and sometimes beyond The authors present the general theory of categories and functors emphasizing inductive and projective limits tensor categories representable functors and objects and localization

Representation Theory and Complex Analysis Michael Cowling, 2008-02-27 Six leading experts lecture on a wide spectrum of recent results on the subject of the title They present a survey of various interactions between representation theory and harmonic analysis on semisimple groups and symmetric spaces and recall the concept of amenability They further illustrate how representation theory is related to quantum computing and much more Taken together this volume provides both a solid reference and deep insights on current research activity

Period Domains over Finite and p -adic Fields Jean-François Dat, Sascha Orlik, Michael Rapoport, 2010-07-08 This book is on the one hand a pedagogical introduction to the formalism of slopes of semi stability and of related concepts in the simplest possible context It is therefore accessible to any graduate student with a basic knowledge in algebraic geometry and algebraic groups On the other hand the book also provides a thorough introduction to the basics of period domains as they appear in the geometric approach to local Langlands correspondences and in the recent conjectural p adic local Langlands program The authors provide numerous worked examples and establish many connections to topics in the general area of algebraic groups over finite and local fields In addition the end of each section includes remarks on open questions historical context and references to the literature

Progress in Commutative Algebra 1 Christopher Francisco, Lee C. Klingler, Sean Sather-Wagstaff, Janet C. Vassilev, 2012-04-26 This is the first of two volumes of a state of the art survey article collection which originates from three commutative algebra sessions at the 2009 Fall Southeastern American Mathematical Society Meeting at Florida Atlantic University The articles reach into diverse areas of commutative algebra and build a bridge between Noetherian and non Noetherian commutative algebra These volumes present current trends in two of the most active areas of commutative algebra non noetherian rings factorization ideal theory integrality and noetherian rings the local theory graded situation and interactions with combinatorics and geometry This volume contains combinatorial and homological surveys The combinatorial papers document some of the increasing focus in commutative algebra recently on the interaction between algebra and combinatorics Specifically one can use combinatorial techniques to investigate resolutions and other algebraic structures as with the papers of Fl ystad on Boij S derburg theory of Geramita Harbourne and Migliore and of Cooper on Hilbert functions of Clark on minimal poset resolutions and of Mermin on simplicial resolutions One can also utilize algebraic invariants to understand combinatorial structures like graphs hypergraphs and simplicial complexes such as in the paper of Morey and Villarreal on edge ideals Homological techniques have become indispensable tools for the study of noetherian rings These ideas have yielded amazing levels of interaction with other fields like algebraic topology via differential graded techniques as well as the foundations of homological algebra analysis via the study of D modules and combinatorics as described in the previous paragraph The homological articles the editors have included in this volume relate mostly to how homological techniques help us better understand rings and singularities both noetherian and non noetherian such as in the papers by Roberts Yao Hummel and Leuschke

Noncommutative Algebraic Geometry and Representations of Quantized Algebras A. Rosenberg, 2013-03-09 This book is based on lectures delivered at Harvard in the Spring of 1991 and at the University of Utah during the academic year 1992 93 Formally the book assumes only general algebraic knowledge rings

modules groups Lie algebras functors etc It is helpful however to know some basics of algebraic geometry and representation theory Each chapter begins with its own introduction and most sections even have a short overview The purpose of what follows is to explain the spirit of the book and how different parts are linked together without entering into details The point of departure is the notion of the left spectrum of an associative ring and the first natural steps of general theory of noncommutative affine quasi affine and projective schemes This material is presented in Chapter I Further developments originated from the requirements of several important examples I tried to understand to begin with the first Weyl algebra and the quantum plane The book reflects these developments as I worked them out in real life and in my lectures In Chapter 11 we study the left spectrum and irreducible representations of a whole lot of rings which are of interest for modern mathematical physics The classes of rings we consider include as special cases quantum plane algebra of q differential operators quantum Heisenberg and Weyl algebras quantum enveloping algebra of the Lie algebra sl_2 coordinate algebra of the quantum group SL_2 the twisted SL_2 of Woronowicz so called Drinfeld algebra and many others

Stereotype Spaces and Algebras Sergei S. Akbarov, 2022-08-22 The term stereotype space was introduced in 1995 and denotes a category of locally convex spaces with surprisingly elegant properties Its study gives an unexpected point of view on functional analysis that brings this field closer to other main branches of mathematics namely to algebra and geometry This volume contains the foundations of the theory of stereotype spaces with accurate definitions formulations proofs and numerous examples illustrating the interaction of this discipline with the category theory the theory of Hopf algebras and the four big geometric disciplines topology differential geometry complex geometry and algebraic geometry

Fundamentals of Advanced Mathematics 1 Henri Bourles, 2017-07-10 This précis comprised of three volumes of which this book is the first exposes the mathematical elements which make up the foundations of a number of contemporary scientific methods modern theory on systems physics and engineering This first volume focuses primarily on algebraic questions categories and functors groups rings modules and algebra Notions are introduced in a general framework and then studied in the context of commutative and homological algebra their application in algebraic topology and geometry is therefore developed These notions play an essential role in algebraic analysis analytical algebraic systems theory of ordinary or partial linear differential equations The book concludes with a study of modules over the main types of rings the rational canonical form of matrices the commutative theory of elementary divisors and their application in systems of linear differential equations with constant coefficients Part of the New Mathematical Methods Systems and Applications series Presents the notions results and proofs necessary to understand and master the various topics Provides a unified notation making the task easier for the reader Includes several summaries of mathematics for engineers

Regular and Irregular Holonomic D-Modules Masaki Kashiwara, Pierre Schapira, 2016-05-26 A unified treatment of the Riemann Hilbert correspondence for not necessarily regular holonomic D modules using sheaves

New Spaces in Mathematics: Volume 1 Mathieu Anel, Gabriel Catren, 2021-04-01 After the

development of manifolds and algebraic varieties in the previous century mathematicians and physicists have continued to advance concepts of space This book and its companion explore various new notions of space including both formal and conceptual points of view as presented by leading experts at the New Spaces in Mathematics and Physics workshop held at the Institut Henri Poincaré in 2015 The chapters in this volume cover a broad range of topics in mathematics including diffeologies synthetic differential geometry microlocal analysis topos theory infinity groupoids homotopy type theory category theoretic methods in geometry stacks derived geometry and noncommutative geometry It is addressed primarily to mathematicians and mathematical physicists but also to historians and philosophers of these disciplines

Moduli Spaces, Virtual Invariants and Shifted Symplectic Structures Young-Hoon Kiem, 2025-03-25 Enumerative geometry is a core area of algebraic geometry that dates back to Apollonius in the second century BCE It asks for the number of geometric figures with desired properties and has many applications from classical geometry to modern physics Typically an enumerative geometry problem is solved by first constructing the space of all geometric figures of fixed type called the moduli space and then finding the subspace of objects satisfying the desired properties Unfortunately many moduli spaces from nature are highly singular and an intersection theory is difficult to make sense of However they come with deeper structures such as perfect obstruction theories which enable us to define nice subsets called virtual fundamental classes Now enumerative numbers called virtual invariants are defined as integrals against the virtual fundamental classes Derived algebraic geometry is a relatively new area of algebraic geometry that is a natural generalization of Serre's intersection theory in the 1950s and Grothendieck's scheme theory in the 1960s Many moduli spaces in enumerative geometry admit natural derived structures as well as shifted symplectic structures The book covers foundations on derived algebraic and symplectic geometry Then it covers foundations on virtual fundamental classes and moduli spaces from a classical algebraic geometry point of view Finally it fuses derived algebraic geometry with enumerative geometry and covers the cutting edge research topics about Donaldson Thomas invariants in dimensions three and four

Triangulated Categories Thorsten Holm, Peter Jørgensen, Raphaël Rouquier, 2010-06-24 Over the last few decades triangulated categories have become increasingly important to the extent that they can now be viewed as a unifying theory underlying major parts of modern mathematics This 2010 collection of survey articles written by leading experts covers fundamental aspects of triangulated categories as well as applications in algebraic geometry representation

theory commutative algebra microlocal analysis and algebraic topology These self contained articles are a useful introduction for graduate students entering the field and a valuable reference for experts

Cohomological Theory of Crystals Over Function Fields Gebhard Böckle, Richard Pink, 2009 This book develops a new cohomological theory for schemes in positive characteristic p and it applies this theory to give a purely algebraic proof of a conjecture of Goss on the rationality of certain L functions arising in the arithmetic of function fields These L functions are power series over a certain ring A associated to any family of Drinfeld A modules or more generally of A motives on a variety of finite type over the finite field \mathbb{F}_p By analogy to the Weil conjecture Goss conjectured that these L functions are in fact rational functions In 1996 Taguchi and Wan gave a first proof of Goss's conjecture by analytic methods à la Dwork The present text introduces A crystals which can be viewed as generalizations of families of A motives and studies their cohomology While A crystals are defined in terms of coherent sheaves together with a Frobenius map in many ways they actually behave like constructible étale sheaves A central result is a Lefschetz trace formula for L functions of A crystals from which the rationality of these L functions is immediate Beyond its application to Goss's L functions the theory of A crystals is closely related to the work of Emerton and Kisin on unit root F crystals and it is essential in an Eichler Shimura type isomorphism for Drinfeld modular forms as constructed by the first author The book is intended for researchers and advanced graduate students interested in the arithmetic of function fields and/or cohomology theories for varieties in positive characteristic It assumes a good working knowledge in algebraic geometry as well as familiarity with homological algebra and derived categories as provided by standard textbooks Beyond that the presentation is largely self contained

Rings, Hopf Algebras, and Brauer Groups Stefaan Caenepeel, 2020-09-29 Based on papers presented at a recent international conference on algebra and algebraic geometry held jointly in Antwerp and Brussels Belgium Presents both survey and research articles featuring new results from the intersection of algebra and geometry
