## **Machine Learning Discriminative And Generative:**

**Machine Learning** Tony Jebara, 2003-12-31 Machine Learning Discriminative and Generative covers the main contemporary themes and tools in machine learning ranging from Bayesian probabilistic models to discriminative support vector machines. However, unlike previous books that only discuss these rather different approaches in isolation, it bridges the two schools of thought together within a common framework elegantly connecting their various theories and making one common big picture. Also, this bridge brings forth new hybrid discriminative generative tools that combine the strengths of both camps. This book serves multiple purposes as well. The framework acts as a scientific breakthrough fusing the areas of generative and discriminative learning and will be of interest to many researchers. However, as a conceptual breakthrough, this common framework unifies many previously unrelated tools and techniques and makes them understandable to a larger portion of the public. This gives the more practical minded engineer, student, and the industrial public an easy access and more sensible road map into the world of machine learning. Machine Learning Discriminative and Generative is designed for an audience composed of researchers, practitioners in industry, and academia. The book is also suitable as a secondary text for graduate level students in computer science and engineering.

Machine Learning Tony Jebara, 2011-05-01 *Principles of Machine Learning* Wenmin Wang, 2024-10-26 Conducting an in depth analysis of machine learning, this book proposes three perspectives for studying machine learning: the learning frameworks, learning paradigms, and learning tasks. With this categorization, the learning frameworks reside within the theoretical perspective, the learning paradigms pertain to the methodological perspective, and the learning tasks are situated within the problematic perspective. Throughout the book, a systematic explication of machine learning principles from these three perspectives is provided, interspersed with some examples. The book is structured into four parts encompassing a total of fifteen chapters. The inaugural part titled Perspectives comprises two chapters: an introductory exposition and an exploration of the conceptual foundations. The second part, Frameworks, is subdivided into five chapters, each dedicated to the discussion of five seminal frameworks: probability, statistics, connectionism, symbolism, and behaviorism. Continuing further, the third part, Paradigms, encompasses four chapters that explain the three paradigms of supervised learning, unsupervised learning, and reinforcement learning, and narrating several quasi-paradigms emerged in machine learning. Finally, the fourth part, Tasks, comprises four chapters delving into the prevalent learning tasks of classification, regression, clustering, and dimensionality reduction. This book provides a multi-dimensional and systematic interpretation of machine learning, rendering it suitable as a textbook reference for senior undergraduates or graduate students pursuing studies in artificial intelligence, machine learning, data science, computer science, and related disciplines. Additionally, it serves as a valuable reference for those engaged in scientific research and technical endeavors within the realm of machine learning. The translation was done with the help of artificial intelligence. A subsequent human revision was done primarily in terms of content.

**Deterministic and Statistical Methods in Machine Learning** Joab Winkler,Neil Lawrence,Mahesan Niranjan,2005-10-11 This book constitutes the refereed proceedings of the First International Workshop on Machine Learning held in Sheffield UK in September 2004. The 19 revised full papers presented were carefully reviewed and selected for inclusion in the book. They address all current issues in the rapidly maturing field of machine learning that aims to provide practical methods for data discovery, categorisation and modelling. The particular focus of the workshop was advanced research methods in machine learning and statistical signal processing.

Machine Learning Andreas Lindholm,Niklas Wahlström,Fredrik Lindsten,Thomas B. Schön,2022-03-31 This book introduces machine learning for readers with some background in basic linear algebra, statistics, probability and programming. In a coherent statistical framework, it covers a selection of supervised machine learning methods from the most fundamental: k-NN, decision trees, linear and logistic regression, to more advanced methods: deep neural networks, support vector machines, Gaussian processes, random forests and boosting, plus commonly used unsupervised methods: generative modeling, k-means, PCA, autoencoders and generative adversarial networks. Careful explanations and pseudo-code are presented for all methods. The authors maintain a focus on the fundamentals by drawing connections between methods and discussing general concepts such as loss functions, maximum likelihood, the bias-variance decomposition, ensemble averaging, kernels and the Bayesian approach, along with generally useful tools such as regularization, cross-validation, evaluation metrics and optimization methods. The final chapters offer practical advice for solving real-world supervised machine learning problems and on ethical aspects of modern machine learning.
