Mastering Today's Software Edward G. Martin, Charles S. Parker, 1993-11-01 *Database Management for Microcomputers* Jan L. Harrington, 1994 This book is primarily intended for use as a text in a database management course that approaches the subject as a business application. It can also be the basis for a short intensive relational database design seminar. Features: The first part of the text focuses on design of relational databases from how systems work to maximising relational design. Chapter 2 reviews the systems development cycle for students who have not recently studied systems analysis and design. The second portion of the text focuses on data manipulation including relational algebra, QBE, interactive SQL and database integrity. The final portion of the text presents the main issues of multiuser databases and data management. Examples in the book involve two case studies: Small Bank and Federated Taxi Company. Two additional case studies form the basis for end of chapter exercises. End of chapter discussion questions and exercises encourage students to view concepts in different contexts and give practice in assessing user needs, formulating good relational designs and creating effective queries. In conjunction with Windows 95 and Visual Basic 4.0 software, this text will help students learn the fundamentals of writing computer applications in a Windows environment. It will allow them to create powerful graphical programs for school, home or business. The authors' project approach takes the student through a seven step programming process to create working applications. As the student's competence grows, step by step instructions become less detailed. Students learn structured programming techniques and a systematic approach to writing and debugging programs that are applicable to any language. At the same time, they become proficient in most of the features of Microsoft Visual Basic 4.0.
