

Dynamic Programming

Definition and Principles

Dynamic programming is a method for solving complex problems by breaking them down into simpler subproblems.

It is applicable to problems with overlapping subproblems and optimal substructure.

Memoization and Tabulation

Memoization stores the results of expensive function calls and reuses them when the same inputs occur again.

Tabulation involves filling up a table iteratively based on the smaller subproblems' solutions.

Common Dynamic Programming Problems

Examples include the Fibonacci sequence, knapsack problem, and longest common subsequence.

Applications of Dynamic Programming

Used in optimization problems, such as in operations research, bioinformatics, and economic planning.
