Laser light is an exquisite tool for physical and chemical research. Physicists have recently developed pulsed lasers with such short durations that one laser shot takes the time of one molecular vibration or one electron rotation in an atom which makes it possible to observe their internal electronic structure thereby enabling the study of physical processes and new chemical reactions. In parallel, advances in micro and nano structured photonic materials allow the precise manipulation of light on its natural scale of a wavelength. Photonic crystals, plasmons and related metamaterials composed of subwavelength nanostructures permit the manipulation of their dispersive properties and have allowed the experimental confirmation of bizarre new effects such as slow light and negative refraction. These advances open a vista on a new era in which it is possible to build lasers and engineer materials to control and use photons as precisely as it is already possible to do with electrons. <http://www.photonics.uottawa.ca/nato/asi/2008/>

Laser Control Of Chemical Dynamics: With Emphasis On Nonadiabatic Transition Hiroki Nakamura, 2024-09-10. Laser control of chemical dynamics is one of the active research fields in molecular science brought about by significant advances in laser technology and further development of quantum control theory. This monograph features the author's outstanding contributions to the field. The first four chapters provide an excellent review of the fundamental subjects that are crucial to understanding laser molecule interactions with the highlight being his Zhu-Nakamura theory of nonadiabatic transition. This is an important basic theory for describing processes relevant to laser control and has been used by scientists around the world because of its simplicity and accuracy. The remaining chapters propose theoretical possibilities of controlling various chemical dynamic processes based on theories discussed earlier in the book.

Cybernetical Physics A. Fradkov, 2007-06-30. Cybernetical physics borrows methods from both theoretical physics and control engineering. It deals with the control of complex systems, which is one of the most important aspects in dealing with systems exhibiting nonlinear behavior or similar features that defy traditional control techniques. This book fully details this new discipline.

Geometric Structures of Phase Space in Multi-Dimensional Chaos Mikito Toda, Tamiki Komatsuzaki, Tetsuro Konishi, R. Stephen Berry, Stuart A. Rice, 2005-01-28. Molecular Reaction Dynamics Raphael D. Levine, 2009-06-04. Molecular reaction dynamics is the study of chemical and physical transformations of matter at the molecular level. The understanding of how chemical reactions occur and how to control them is fundamental to chemists and interdisciplinary areas such as materials and nanoscience, rational drug design, environmental and astrochemistry. This book provides a thorough foundation to this area. The first half is introductory, detailing experimental techniques for initiating and probing reaction dynamics and the essential insights that have been gained. The second part explores key areas including photoselective chemistry, stereochemistry, chemical reactions in real time and chemical reaction dynamics in solutions and interfaces. Typical of the new challenges are molecular machines.

Conical Intersections Wolfgang Domcke, David Yarkony, 2011 The concept of adiabatic electronic potential energy surfaces defined by the Born Oppenheimer approximation is fundamental to our thinking about chemical processes Recent computational as well as experimental studies have produced ample evidence that the so called conical intersections of electronic energy surfaces predicted by von Neumann and Wigner in 1929 are the rule rather than the exception in polyatomic molecules It is nowadays increasingly recognized that conical intersections play a key mechanistic role in chemical reaction dynamics This volume provides an up to date overview of the multi faceted research on the role of conical intersections in photochemistry and photobiology including basic theoretical concepts novel computational strategies as well as innovative experiments The contents and discussions will be of value to advanced students and researchers in photochemistry molecular spectroscopy and related areas
