Recent results and new trends are discussed in the analysis of numerical algorithms as well as their application to challenging scientific and industrial problems. The topics of ENUMATH 99 included finite element methods, a posteriori error control and adaptive mesh design, non-matching grids, least squares methods for partial differential equations, boundary element methods and optimization in partial differential equations. Apart from theoretical aspects, a major part of the conference was devoted to numerical methods in interdisciplinary applications such as problems in computational fluid electrodynamics, telecommunications, software as well as visualization.

Numerical Mathematics and Advanced

Applications F. Brezzi, A. Buffa, S. Corsaro, A. Murli, 2012-12-06 Scientific computing is a fast growing and fast changing area whose applications to various branches of science, engineering, medicine, economics and others are increasing in number and relevance every day. There are two main reasons among others that make scientific computing change so rapidly. One is the increasing number of different research areas beginning to make use of numerical simulation, from nanotechnology to genomics, from computer-aided diagnosis and operations in medical applications which involve often complete simulations of parts of the human body to economics and finance. Each new application and each new aspect of earlier applications draws heavily on the know-how that has been acquired on other problems with similar mathematical features. It has to be pointed out that the lofty perspective of mathematics succeeds quite often in finding connections among very different phenomena that turn out in the end to share the same mathematical and numerical structure. In turn, new applications contribute to the cross-fertilization by sending back new interpretations and suggestions which are often useful in more classical applications. All this creates a resonance effect that contributes greatly to the growth rate of the whole field.
