Separation Techniques 2:

Separation Techniques Applied to Omics Sciences Ana Valéria Colnaghi Simionato, 2021-10-09 This book covers liquid chromatography gas chromatography and capillary electrophoresis the three main separation techniques lately available applied to key omic sciences such as genomics proteomics metabolomics and foodomics The fundamentals of each technique are not covered herein Instead the recent advances in such techniques are presented focusing on the application to omics analyses and unique aspects in each case This volume intends to offer wide ranging options available to researchers on omics sciences and how to integrate them in order to achieve the comprehension of a biological system as a whole Omic sciences have been of ultimate importance to comprehend the complex biochemical reactions and related events that occurs upon a biological system The classical central dogma of molecular biology which states that genetic information flows unidirectionally from DNA to RNA and then to proteins has been gradually replaced by the systems biology approach This book presents a multidisciplinary approach that explains the biological system as a whole where the entire organism is influenced by a variety of internal events as well as by the environment showing that each level of the biological information flux may influence the previous or the subsequent one

Luque de Castro, Miguel Valcarcel, Maria T. Tena, 2012-12-06

Recent advances in analytical chemistry have turned it into a virtually unrecognizable science compared to a few decades ago when it lagged behind other sciences and techniques However advances in analytical science have been far from universal while innovations in instrumentation and data acquisition and processing systems have reached unprecedented levels thanks to parallel breakthroughs in computer science and chemo metrics progress in preliminary operations has been much slower despite their importance to analytical results Thus such clear trends in analytical process development as automation and miniaturization have not reached preliminary operations to the same extent even though this area is probably in the greatest need Improvement in preliminary operations is thus an urgent goal of analytical chemistry on the verge of the twenty first century Increased R D endeavours and manufacture of commercially available automatic equipment for implementation of the wide variety of operations that separate the uncollected unmeasured untreated sample from the signal measuring step are thus crucial on account of the wide variability of such operations which precludes development of all purpose equipment and the complexity of some particularly relating to solid samples Supercritical fluid extraction opens up interesting prospects in this context and is no doubt an effective approach to automatio1 and mini aturization in the preliminary steps of the analytical process The dramatic developments achieved in its short life are atypical in many respects
