

developed in subsequent chapters, is that analysis of the imaging data must take into account the ambition of explaining why and how the functional architecture of the brain results in the phenomena of thought, perception and action. Much of the first part of the book, which incidentally is beautifully produced and illustrated, develops this idea with a technical perspective based on experience developed with positron emission tomography (PET). However, the book is organised so that the reader is soon led beyond this specific base to newer methods and more generalisable techniques of image analysis.

An important part of the book is the section outlining concisely the technical bases for measurements of blood flow and cerebral metabolism that are most frequently used to study the living brain. It describes the theoretical and mathematical foundations of the generation of functional images from external measurements. Of topical interest is an introduction to the potential of generating functional images with magnetic resonance (fMRI) that is an expert critique of the advantages and limitations of this method, especially in relation to the nature of the signals recorded.

Following descriptions of functional mapping using unimodal images in individuals, a major portion of the book proceeds to explore and describe the statistical and methodological aspects of combining and correlating imaging data between subjects. The different approaches being taken to resolve these technical issues are all extensively described in a clear and highly relevant way. Novel methods for the statistical analysis of inter- and intra-subject mapping data and new ways of communicating, visualising and integrating such information are another principal focus of the book.

The techniques developed to solve problems of intersubject comparisons lead themselves to integration of complementary measurements. A continuing theme of the book is the need to correlate function with anatomical structure which poses problems of registration of images from different modalities. The various techniques and problems of modelling and registering electrical and magnetic measurements, with their rapid time courses, are discussed in detail. A major new effort is being directed at the integration of spatial and temporal information about the distribution of brain activity. This area, that represents the forefront of imaging research at present, is well discussed in the final section of 10 chapters.

In his introduction, one of the book's editors, Robert Thatcher, explains the need to produce a work of this nature, believing there is enough common ground between all the sub-disciplines of functional imaging to warrant "publishing in one place some of the most recent advancements in the field". The depth and breadth of the book show that he has, indeed, been successful. The intended readership of (methodologically motivated) neuroscientists, graduate students, psychologists, neuropsychologists, neurologists, neurosurgeons, radiologists, psychiatrists and those interested in the use of MEG, EEG, MRI and PET to study brain function will find it a valuable source volume and an excellent, if technical, overview of the current status of the field.

Sexual Dysfunction: A Neuro-Medical Approach. Edited by CARLOS SANCHEZ and WILLIAM WIDMER (Pp 375 \$50.) Published by Futura Publishing Company Inc, Armonk 1994. ISBN 0-87993-582-0.

The book claims to take a "neuro-medical" approach to the problems of sexual dysfunction which is an important distinction from other texts available which have mostly been written by urologists with titles like "Impotence". Impressively, this book starts with an account of the sexual response cycle in the two genders and there are nine pages about this in women and seven pages in men. This sets the tone for the rest of the book which gives due attention to the female perspective throughout. It is a multi-author book written by 31 North American authors and there is a strong neurological contributing team.

Several chapters are particularly illuminating. For example the introduction of intracorporeal injections for the treatment of erectile difficulties has increased the need for accurate penile circumference studies but the type of continuing referrals to the laboratory are "complex cases, legal, physicians, foreign dignitaries and celebrities". It is interesting to read how this means of research became established—it has certainly contributed greatly to research.

Throughout the book an utterly professional tone is adopted but a glimmer of humour breaks through when discussing the possibly less serious matter of premature ejaculation. The authors postulate it is due to "a tendency to ejaculate at lower levels of sexual arousal. One possible mechanism is a lower rate of sexual intercourse as compared to control subjects, a notion with obvious therapeutic implications".

There is very sensible advice on the problem of impotence in men urging clinicians to recognise the various underlying possible organic causes rather than diagnose psychogenic disorders. Inevitably the equivalent chapter about women veers towards examining female sexuality and the feminist scholar's view of the body image issue, but this is not the fault of the authors, rather the dearth of knowledge about medical disorders that effect the female sexual response. There is a balanced view of when neurophysiological investigations are contributory—a subject which has been given extensive coverage by scribbles in urological journals.

In general this is a very complete account of the problem written from a neurological point of view and therefore of considerable interest to readers of this journal who wish to know more about the subject.

Movement Disorders III. Edited by C DAVID MARSDEN and STANLEY FAIRDALE (Pp 529; Price: £50.00). 1994. Butterworth-Heinemann, Oxford. ISBN 0 7506 1412 9.

In a series of books designed to help "physicians who grapple with the problem of neurological disease on a daily basis," it is probably appropriate that movement disorders should have so far taken up three of the fourteen volumes in Butterworth-Heinemann's International Medical Review series. The treatment of Parkinson's disease

forms a substantial part of the average working neurologist's clinic time, whilst most movement disorders like paroxysmal kinesogenic choreoathetosis and dentatorubropallidolysian atrophy await barking to test our diagnostic skills. Hyperekplexia starts us with their rarity in the ordinary clinic but anthropologically crude neurologists will recognise Lath, Myriachit, Yvon, bath-sche, mall-mall, lama, and ragin' Cajuns not to mention the jumping Frenchman of Moosehead Lake in Maine. Similarly though hemifacial spasm is commonplace in neurological practice, we do not often recognise such entities as 'Belly Dancer's Dyskinesia', which despite its name, is not Salome's occupational dystonia. Movement Disorders 3 contains all these wonders and more.

The spine of my copy of Movement Disorders 1 is bleached green from the sun and comparison of its contents with those of its still blue younger sibling demonstrates how movement disorders have advanced in the last 12 years. Transplantation of neural tissue for the treatment of human Parkinson's disease was little more than a dream in 1982 whilst this occupies two chapters in the 1994 volume. Similarly PET imaging of dopamine uptake was yet to be described when Movement Disorders 1 was put to press, whilst in volume 3 mention of this technique is scattered all over, not just in the chapter devoted to functional imaging of movement disorders. Trinucleotide repeats were just genetic echolalia in the early 1980's but now even Anita Harding's excellent chapter on the genetics of movement disorders is out of date in mentioning only three diseases other than Huntington's in which expansion of such a repeat appears to be the genetic pathology. Similarly over the last decade much discussion has occurred about the nosology of non-Parkinson's disease. Although clinicians watched out for rigid patients with postural hypotension or eye movement paralysis, these were considered to be pretty rare stamps whilst now we know that many more than we suspected of our 'Parkinson's patients' have a non-Lewy body disease unresponsive to L-dopa. Alien hands are now recognised as a manifestation of corticobasal degeneration, which gets a whole chapter in this book, being a nosological child of the eighties (albeit nearly stillborn in the late sixties). All these problems are well covered in this book, the largest share of which is devoted to Parkinson's own disease (although, as Niall Quinn points out, even some of James' cases were probably non-Parkinsonian). The detailed anatomy of the basal ganglia is here for those that like to exercise their hippocampus with circuit diagrams, as well as concise reviews of experimental models of Parkinson's disease and a good chapter on eye movements in basal ganglia disease. The second half of the book is a cornucopia of stereotypes, stiff people, startle syndromes and many other dyskinesias with a helpful introduction by the editors to these tricky disorders.

This latest Movement disorders volume is to be recommended to clinicians who want to keep ahead with the management of and the latest science about one of the commonest treatable diseases seen in neurological clinics as well as of some of the most extraordinary.

Neurorehabilitation Mindy L. Bodis-Wollner, 2007-11-10 Parkinson s Disease and Nonmotor Dysfunction fills a major gap in the current rapidly growing body of knowledge concerning Parkinson s disease Drs Pfeiffer and Bodis Wollner have correctly perceived that many nonmotor features of Parkinson s disease are given insufficient attention in the medical literature Unfortunately they are

often also given insufficient attention by the practicing neurologists who see these patients As recently pointed out there is clearly much more to Parkinson s disease than depletion of the nigrostriatal dopamine system 1 Parkinson s disease not just multiple system atrophy is a multisystem disorder both pathologically and in its clinical manifestations This is clearly true for the various motor system abnormalities which are not fully corrected by dopamine replacement therapy strategies but also for the nonmotor system abnormalities that are the subject of this volume Although recently there has been increased awareness of the cognitive psychiatric and sleep disorders commonly associated with Parkinson s disease many of their manifestations remain under recognized and their importance in managing patients is underestimated Even less attention is paid to the myriad of other nonmotor disturbances that plague these patients For example among the autonomic disorders although orthostatic hypotension is well recognized it is usually attributed to dopaminergic medications rather than to effects of the underlying disease Urologic disorders are also very familiar in these patients but may not be properly understood or well managed
