Life,Narborough-Hall,1990-09-20 From a May 1989 conference in Brighton England 18 papers address the utility and problems of simulation techniques in developing human computer interfaces Many of the themes also have application to other human machine work systems The sections each with an overview cover general issues such as extrapolating from one task to another and operational evaluation embedded simulations discrete dialogue computing systems and continuous dynamic control systems Annotation copyrighted by Book News Inc Portland OR

The Impact of the User Interface on Simulation Usability and Solution Quality Bruce Montgomery,2011 This research outlines a study that was performed to determine the effects of user interface design variations on the usability and solution quality of complex multivariate discrete event simulations Specifically this study examined four key research questions what are the user interface considerations for a given simulation model what are the current best practices in user interface design for simulations how is usability best evaluated for simulation interfaces and specifically what are the measured effects of varying levels of usability of interface elements on simulation operations such as data entry and solution analysis The overall goal of the study was to show the benefit of applied usability practices in simulation design supported by experimental evidence from testing two alternative simulation user interfaces designed with varying usability The study employed directed research in usability and simulation design to support design of an experiment that addressed the core problem of interface effects on simulation In keeping with the study goal of demonstrating usability practices the experimental procedures were analogous to the development processes recommended in supporting literature for usability based design lifecycles Steps included user and task analysis concept and use modeling paper prototypes of user interfaces for initial usability assessment interface development and assessment and user based testing of actual interfaces with an actual simulation model The experimental tests employed two interfaces designed with selected usability variations each interacting with the same core simulation model The experimental steps were followed by an analysis of quantitative and qualitative data gathered including data entry time interaction errors solution quality measures and user acceptance data The study resulted in mixed support for the hypotheses that improvements in usability of simulation interface elements will improve data entry solution quality and overall simulation interactions Evidence for data entry was mixed for solution quality was positive to neutral and for overall usability was very positive As a secondary benefit the study demonstrated application of usability based interface design best practices and processes that could provide guidelines for increasing usability of future discrete event simulation interface designs Examination of the study results also provided suggestions for possible future research on the investigation topics

Seeing Between the Pixels Christine Strothotte,Thomas Strothotte,2012-12-06 Pictures are at the heart of how we communicate with computers emblematic of our cur rent fascination with multimedia and web based computing Nevertheless most of us know far less about pictures and the way in which they work than we know about the text that often accompanies them In an attempt to understand pictures perhaps the most fundamental question we can ask is What is a

picture What is it that objects as diverse as icons bar charts paintings and photographs have in common that makes us refer to all of them as pictures And what is it about pictures that convinces us to use them instead of or in addition to text We often talk about how pictures depict things But even the process of depiction seems to differ from one picture to another On a computer we may use a paint system to guide a virtual brush over the screen a video camera to capture a live image a spreadsheet to automatically generate a corresponding bar chart or a rendering system that models the interactions of synthetic lights objects and cameras Is there some underlying property that these processes all share Computer scientists are used to thinking of pictures in terms of their representation an array of pixels a list or hierarchy of graphics primitives or even a program written in a language such as PostScript
