discoveries in mathematics and science to make such 3D magic possible and The History of Visual Magic in Computers is dedicated to all of them and tells a little of their story It traces the earliest understanding of 3D and then foundational mathematics to explain and construct 3D from mechanical computers up to today's tablets Several of the amazing computer graphics algorithms and tricks came of periods where eruptions of new ideas and techniques seem to occur all at once Applications emerged as the fundamentals of how to draw lines and create realistic images were better understood leading to hardware 3D controllers that drive the display all the way to stereovision and virtual reality

Computer Graphics Techniques David F. Rogers,Rae Earnshaw,2001-10-31 In the third paper in this chapter Mike Pratt provides an historical intro duction to solid modeling He presents the development of the three most frequently used techniques cellular subdivision constructive solid modeling and boundary representation Although each of these techniques devel oped more or less independently today the designer s needs dictate that a successful system allows access to all of these methods For example sculptured surfaces are generally represented using a boundary represen tation However the design of a complex vehicle generally dictates that a sculptured surface representation is most efficient for the skin while constructive solid geometry representation is most efficient for the inter nal mechanism Pratt also discusses the emerging concept of design by feature line Finally he addresses the very important problem of data exchange between solid modeling systems and the progress that is being made towards developing an international standard With the advent of reasonably low cost scientific workstations with rea sonable to outstanding graphics capabilities scientists and engineers are increasingly turning to computer analysis for answers to fundamental ques tions and to computer graphics for present tion of those answers Although the current crop of workstations exhibit quite impressive computational ca pability they are still not capable of solving many problems in a reasonable time frame e g executing computational fluid dynamics and finite element codes or generating complex ray traced or radiosity based images In the sixth chapter Mike Muuss of the U S Confluence of Computer Vision and Computer Graphics Ales Leonardis,F.
