**The Mathematical Theory of Information** Jan Kåhre, 2012-12-06 The general concept of information is here for the first time defined mathematically by adding one single axiom to the probability theory This Mathematical Theory of Information is explored in fourteen chapters 1 Information can be measured in different units in anything from bits to dollars We will here argue that any measure is acceptable if it does not violate the Law of Diminishing Information This law is supported by two independent arguments one derived from the Bar Hillel ideal receiver the other is based on Shannon's noisy channel The entropy in the classical information theory is one of the measures conforming to the Law of Diminishing Information but it has however properties such as being symmetric which makes it unsuitable for some applications The measure reliability is found to be a universal information measure 2 For discrete and finite signals the Law of Diminishing Information is defined mathematically using probability theory and matrix algebra 3 The Law of Diminishing Information is used as an axiom to derive essential properties of information Byron's law there is more information in a lie than in gibberish Preservation no information is lost in a reversible channel Etc The Mathematical Theory of Information supports colligation i.e. the property to bind facts together making two plus two greater than four Colligation is a must when the information carries knowledge or is a base for decisions In such cases reliability is always a useful information measure Entropy does not allow colligation

**Recent Contributions to the Mathematical Theory of Communication** Warren Weaver, 1949 *A Sociological Theory of Communication* Loet Leydesdorff, 2001-01-01 Networks of communication evolve in terms of reflexive exchanges The codification of these reflections in language that is at the social level can be considered as the operating system of society Under sociologically specifiable conditions the discursive reconstructions can be expected to make the systems under reflection increasingly knowledge intensive This sociological theory of communication is founded in a tradition that includes Giddens' 1979 structuration theory Habermas' 1981 theory of communicative action and Luhmann's 1984 proposal to consider social systems as self-organizing The study also elaborates on Shannon's 1948 mathematical theory of communication for the formalization and operationalization of the non-linear dynamics The development of scientific communications can be studied using citation analysis The exchange media at the interfaces of knowledge production provide us with the evolutionary model of a Triple Helix of university industry government relations The construction of the European Information Society can then be analyzed in terms of interacting networks of communication The issues of sustainable development and the expectation of social change are discussed in relation to the possibility of a
