Commodity and Resource Policies in Agricultural Systems Richard E. Just, Nancy Bockstael, 2012-12-06 Agricultural natural resource and environmental problems are becoming increasingly interdependent For example soil erosion is largely determined by agricultural land use Both water use and water contamination depend on land use and technology choice in agriculture In many areas the fertilizers and pesticides used in agriculture are major pollutants of ground and surface water having adverse effects on drinking water and fisheries Agricultural pollutants such as pesticides also produce adverse health effects for agricultural workers and the consuming public On the other hand the availability of water resources and the value of competing land uses influence agricultural production Additionally regional air quality problems may affect crops and global environmental trends may have long term implications for farming Agriculture natural resources and environmental quality are all heavily regulated in the U S but they are done so by a vast array of competing or unrelated agencies within the U S Departments of Agriculture Interior and Commerce the Environmental Protection Agency and numerous state agencies Considering the large number of bureaucratically remote public agencies involved and the pervasive interdependencies between agriculture natural resources and the environment policies develop which are at best uncoordinated and at worst conflicting and counterproductive These policies have become sources of controversy as different interest groups struggle to affect their implementation as different agencies have fought for administrative control and as legislative bodies have attempted to enact piecemeal changes
