Mathematical Systems Theory in Biology, Communications, Computation and Finance Joachim

Rosenthal, David S. Gilliam, 2012-12-06 Mathematical systems theory is a vibrant research area in its own right. The theory has an impact in numerous applications areas including aeronautics, biological systems, chemical engineering, communication systems, financial engineering, and robotics to name just a few. This volume contains survey and research articles by some of the leading researchers in mathematical systems theory. Many authors have taken special care that their articles are self-contained and accessible also to non-specialists. The articles contained in this volume are from those presented as plenary lectures, invited one-hour lectures, and minisymposia at the 15th International Symposium on the Mathematical Theory of Networks and Systems held at the University of Notre Dame August 12-16, 2002. *Mathematical Methods in Biology and Neurobiology* Jürgen Jost, 2014-02-13 Mathematical models can be used to meet many of the challenges and opportunities offered by modern biology. The description of biological phenomena requires a range of mathematical theories. This is the case particularly for the emerging field of systems biology. *Mathematical Methods in Biology and Neurobiology* introduces and develops these mathematical structures and methods in a systematic manner. It studies discrete structures and graph theory, stochastic processes, dynamical systems, and partial differential equations, optimization, and the calculus of variations. The biological applications range from molecular to evolutionary and ecological levels, for example, cellular reaction kinetics and gene regulation, biological pattern formation and chemotaxis, the biophysics and dynamics of neurons, the coding of information in neuronal systems, phylogenetic tree reconstruction, branching processes, and population genetics, optimal resource allocation, sexual recombination, the interaction of species. Written by one of the most experienced and successful authors of advanced mathematical textbooks, this book stands apart for the wide range of mathematical tools that are featured. It will be useful for graduate students and researchers in mathematics and physics that want a comprehensive overview and a working knowledge of the mathematical tools that can be applied in biology. It will also be useful for biologists with some mathematical background that want to learn more about the mathematical methods available to deal with biological structures and data. **Computer Aided Systems Theory - EUROCAST'99** Franz Pichler, Roberto Moreno-Diaz, Peter Kopacek, 2007-03-02 Computer Aided Systems Theory (CAST) deals with the task of contributing to the creation and implementation of tools for the support of usual CAD tools for design and simulation by formal mathematical or logical means in modeling. Naturally, the basis for the construction and implementation of CAST software is provided by the existing current knowledge in modeling and by the experience of practitioners in engineering design. Systems Theory, as seen from the viewpoint of CAST research and CAST tool development, has the role of providing formal frameworks and related theoretical knowledge for model construction and model analysis. We purposely do not distinguish sharply between systems theory and CAST and other similar fields of research and tool development such as, for example, in applied numerical analysis or other computational sciences. The here documented EUROCAST conference which took place at the Vienna University of Technology reflects current mainstreams in CAST. As in the previous conferences, new topics both theoretical and application

oriented have been addressed The presented papers show that the field is widespread and that new developments in computer science and in information technology are the driving forces

The editors would like to thank the authors for providing their manuscripts in hard copy and in electronic form on time The staff of Springer Verlag Heidelberg gave as in previous CAST publications valuable support in editing this volume

Computer Aided Systems Theory - EUROCAST 2019 Roberto Moreno-Díaz, Franz Pichler, Alexis Quesada-Arencibia, 2020-04-15 The two volume set LNCS 12013 and 12014 constitutes the thoroughly refereed proceedings of the 17th International Conference on Computer Aided Systems Theory EUROCAST 2019 held in Las Palmas de Gran Canaria Spain in February 2019 The 123 full papers presented were carefully reviewed and selected from 172 submissions The papers are organized in the following topical sections Part I systems theory and applications pioneers and landmarks in the development of information and communication technologies stochastic models and applications to natural social and technical systems theory and applications of metaheuristic algorithms model based system design verification and simulation Part II applications of signal processing technology artificial intelligence and data mining for intelligent transportation systems and smart mobility computer vision machine learning for image analysis and applications computer and systems based methods and electronic technologies in medicine advances in biomedical signal and image processing systems concepts and methods in touristic flows systems in industrial robotics automation and IoT

Three Decades of Mathematical System Theory Hendrik Nijmeijer, Johannes M Schumacher, 2014-01-15 The field of modern mathematical system theory has its origins in the work of R E Kalman in the late fifties It came to a rapid development in the early sixties and has seen a continuing and still growing stream of contributions in the years that followed Today it stands as a well established discipline The volume *Three Decades of Mathematical System Theory* surveys the developments in this field by presenting 21 articles covering the broad area of system and control theory All articles have been written by well known authors who were invited to give their personal expert view on a particular direction of research Together the contributions in this volume review the wide range of mathematical methods that are being applied in modern system and control theory The mathematical fields that are involved included differential and algebraic geometry linear and commutative algebra and functional and stochastic analysis

A Primer for a Secret Shortcut to PDEs of Mathematical Physics Des McGhee, Rainer Picard, Sascha Trostorff, Marcus Waurick, 2020-08-24 This book presents a concise introduction to a unified Hilbert space approach to the mathematical modelling of physical phenomena which has been developed over recent years by Picard and his co workers

The main focus is on time dependent partial differential equations with a particular structure in the Hilbert space setting that ensures well posedness and causality two essential properties of any reasonable model in mathematical physics or engineering However the application of the theory to other types of equations is also demonstrated By means of illustrative examples from the straightforward to the more complex the authors show that many of the classical models in mathematical physics as well as more recent models of novel materials and interactions are covered or can be restructured to be covered by this unified Hilbert space approach The reader should require only a basic foundation in the theory of Hilbert spaces and operators therein For convenience however some of the more technical background requirements are covered in detail in two appendices The theory is kept as elementary as possible making the material suitable for a senior undergraduate or master s level course In addition researchers in a variety of fields whose work involves partial differential equations and applied operator theory will also greatly benefit from this approach to structuring their mathematical models in order that the general theory can be applied to ensure the essential properties of well posedness and causality
