precise knowledge of the structure of biological macromolecules forms the basis of understanding their function and their mechanism of action. It also lays the foundation for rational protein and drug design. The only method to obtain this knowledge is still crystallography. At present the structures of about 400 proteins are known at or nearly at atomic resolution. However, only two of them are membrane proteins or complexes of the membrane proteins. The reasons for the difference is not that the crystals of membrane proteins resist forming, special problems when being analysed. The reason is that the membrane proteins resist forming into well ordered crystals. The intention of this book is to help to produce well ordered crystals of proteins and to provide guidelines, it is aimed at both biochemists and protein crystallographers. **Dynamic**
