Signal Analysis and Prediction Ales Prochazka,N.G. Kingsbury,P.J.W. Payner,J. Uhler,2013-11-11 Methods of signal analysis represent a broad research topic with applications in many disciplines including engineering technology biomedicine seismography econometrics and many others based upon the processing of observed variables Even though these applications are widely different the mathematical background behind them is similar and includes the use of the discrete Fourier transform and z transform for signal analysis and both linear and non linear methods for signal identification modelling prediction segmentation and classification These methods are in many cases closely related to optimization problems statistical methods and artificial neural networks This book incorporates a collection of research papers based upon selected contributions presented at the First European Conference on Signal Analysis and Prediction ECSAP 97 in Prague Czech Republic held June 24-27 1997 at the Strahov Monastery Even though the Conference was intended as a European Conference at first initiated by the European Association for Signal Processing EURASIP it was very gratifying that it also drew significant support from other important scientific societies including the IEE Signal Processing Society of IEEE and the Acoustical Society of America The organizing committee was pleased that the response from the academic community to participate at this Conference was very large 128 summaries written by 242 authors from 36 countries were received In addition the Conference qualified under the Continuing Professional Development Scheme to provide PD units for participants and contributors

Numerical Bayesian Methods Applied to Signal Processing Joseph J.K. O'Ruanaidh,William J. Fitzgerald,2012-12-06 This book is concerned with the processing of signals that have been sampled and digitized The fundamental theory behind Digital Signal Processing has been in existence for decades and has extensive applications to the fields of speech and data communications biomedical engineering acoustics sonar radar seismology oil exploration instrumentation and audio signal processing to name but a few 87 The term Digital Signal Processing in its broadest sense could apply to any operation carried out on a finite set of measurements for whatever purpose A book on signal processing would usually contain detailed descriptions of the standard mathematical machinery often used to describe signals It would also motivate an approach to real world problems based on concepts and results developed in linear systems theory that make use of some rather interesting properties of the time and frequency domain representations of signals While this book assumes some familiarity with traditional methods the emphasis is altogether quite different The aim is to describe general methods for carrying out optimal signal processing

Advanced Topics in Shannon Sampling and Interpolation Theory Robert J. II Marks,2012-12-06 *Advanced Topics in Shannon Sampling*

and Interpolation Theory is the second volume of a textbook on signal analysis solely devoted to the topic of sampling and restoration of continuous time signals and images Sampling and reconstruction are fundamental problems in any field that deals with real time signals or images including communication engineering image processing seismology speech recognition and digital signal processing This second volume includes contributions from leading researchers in the field on such topics as Gabor's signal expansion sampling in optical image formation linear prediction theory polar and spiral sampling theory interpolation from nonuniform samples an extension of Papoulis's generalized sampling expansion to higher dimensions and applications of sampling theory to optics and to time frequency representations The exhaustive bibliography on Shannon sampling theory will make this an invaluable research tool as well as an excellent text for students planning further research in the field
