Radar OTHR network has some potential for this role The OTHR operates in the HF band and is constrained by the propagation effects of the ionosphere A spherically stratified ionospheric model and a model for a nominal OTHR antenna are developed that allow calculation of path propagation power distribution and clutter returns *Understanding Radar Systems* Simon Kingsley, Shaun Quegan, 1999 What is radar What systems are currently in use How do they work Understanding Radar Systems provides engineers and scientists with answers to these critical questions focusing on actual radar systems in use today It is the perfect resource for those just entering the field or a quick refresher for experienced practitioners The book leads readers through the specialized language and calculations that comprise the complex world of modern radar engineering as seen in dozens of state of the art radar systems The authors stress practical concepts that apply to all radar keeping math to a minimum Most of the book is based on real radar systems rather than theoretical studies The result is a valuable easy to use guide that makes the difficult parts of the field easier and helps readers do performance calculations quickly and easily **Information on Over-the-Horizon Radar**, 1964 Over-The-Horizon (OTH) Radar System Continental United States. Andreevich Mishchenko, United States. Joint Publications Research Service, 1972 **Hearings** United States. Congress. House. Committee on Armed Services, 1969 *HF Over-the-horizon Radar System Performance Analysis*, 2007 The basic concept of the structure and properties of the ionosphere are discussed to explain how the performance of the over the horizon radar OTHR system is affected An overview of the OTHR system characteristics and performance are presented along with some applications currently used around the world including their geographic location and historical background The waveforms used for the OTHR systems include simple pulse pulse Doppler phased coded pulse frequency modulated continuous wave FMCW and frequency modulated interrupt continuous wave FMICW Other characteristics such as target detection methods and the skywave OTHR range equation are also discussed Simulation results indicate that the minimum required input signal to noise ratio SNR for a target with 100 m² cross section at 3 500 km footprint range is 52.4 dB at c f

14 5 MHz In addition a noncooperative intercept receiver requires a minimum input SNR of 94 dB for a square law detector and 97 dB for a linear detector for interception at a footprint range of 3 500 km at c f 14 5 MHz A model of the maximum detection range for the Chinese FMCW OTH backscatter OTH B radar was developed in MATLAB An intercept receiver maximum interception range is also analyzed A ray tracing technique is also used in PROPLAB to present a more detailed analysis The analysis includes the electron density profile the maximum usable frequency the critical frequency of the layers the skip zone and the signal quality The simulations focused on the Chinese OTH B radar system are to investigate the Chinese surveillance capabilities
