## **Oxygen Basis Of The Regulation Of Vital Functions In The Fetus:**

**OXYGEN: Basis of the Regulation of Vital Functions in the Fetus** Wolfgang Künzel, Michael Kirschbaum, 2012-12-06  
an adequate oxygen supply is vital for the undisturbed development of the fetus and its functions This book gives a synopsis of the ruling influence that oxygen has in multiple regulation systems in the mother and especially in the fetus The authors consider oxygen as a manipulated variable or as a corrective element during normal pregnancy during delivery and during acute and chronic oxygen deficiency Furthermore they deal with the consequences that oxygen deficiency has on the fetus

**Oxygen** Wolfgang Künzel, Michael Kirschbaum, 1992-01-01 an adequate oxygen supply is vital for the undisturbed development of the fetus and its functions This book gives a synopsis of the ruling influence that oxygen has in multiple regulation systems in the mother and especially in the fetus The authors consider oxygen as a manipulated variable or as a corrective element during normal pregnancy during delivery and during acute and chronic oxygen deficiency Furthermore they deal with the consequences that oxygen deficiency has on the fetus Fetus and Neonate: Physiology and Clinical Applications: Volume 1, The Circulation Mark A. Hanson, John A. D. Spencer, Charles H. Rodeck, 1993-04-15 The Fetus and Neonate is a series of practical focused texts which concentrate on that critical period of human development from late fetal to neonatal life Each volume in the series examines a particular body system looking at the physiological mechanisms which underlie the transition from intrauterine to extrauterine life and the pathophysiological processes which may occur in this period Each volume will consider the application of new basic scientific knowledge to the clinical situation This series will be a valuable source of information to practitioners and postgraduate trainees in obstetrics neonatology paediatrics and reproductive medicine as well as to basic scientists in these fields **New Approaches to the Pathogenesis of Sudden**

**Intrauterine Unexplained Death and Sudden Infant Death Syndrome** Anna M. Lavezzi, Conrad E. Johanson, 2017-10-03  
Sudden Infant Death Syndrome SIDS is the leading cause of death among infants in the first year of age The more known definition of SIDS is the sudden unexpected death of an infant less than 1 year of age with onset of the fatal episode apparently occurring during sleep that remains unexplained after a thorough investigation including performance of a complete autopsy and review of the circumstances of death and the clinical history Despite the success of the Back to Sleep campaigns to reduce the risks introduced worldwide the frequency of SIDS striking one infant every 750 1 000 live births has not significantly declined in the last years Sudden Intrauterine Unexplained Death Syndrome SIUDS referring to fetuses that die unexpectedly particularly in the last weeks of gestation without any cause even after a complete autopsy including examination of the placental disk umbilical cord and fetal membranes has a six eightfold greater incidence than that of SIDS Even if the pathogenetic mechanism of these deaths has not yet been determined the neuropathology seems to be a consistent substrate in both SIUDS and SIDS Subtle common developmental abnormalities of brainstem nuclei checking the vital functions have been highlighted frequently related to environmental risk factors such as cigarette smoke air and water

pollution pesticides food contamination etc Exogenous toxic factors can in fact interact in complex ways with the genetic constitution of the infant leading to polymorphisms and or mutations of specific genes as polymorphisms of the serotonin transporter gene 5 HTT the regulator of the synaptic serotonin concentration and of the PHOX2B the key gene in the Congenital Central Hypoventilation Syndrome These interactions can directly injure the development of the autonomic nervous system frequently resulting in hypoplasia of the vital brainstem centers and consequently in sudden death It is very important to continue studying these syndromes and in particular identify all possible congenital alterations and their correlation with the exposure to environmental risk factors in order to reduce their incidence and mitigate the surrounding social concern The goal of this research topic is to propose new approaches to explain the pathogenesis of both SIUDS and SIDS and consequently new prevention strategies to decrease the incidence of these unexpected and very devastating events for families Expert authors in the Topic field are encouraged to submit original research articles aimed to widen the current knowledge on the pathological substrates of these deaths also considering the correlations with possible risk factors Submissions of hypotheses opinions and commentaries are also welcome This Research Topic would lead to development of targeted risk lowering strategies to reduce the incidence of both SIUDS and SIDS Furthermore the adoption of appropriate preventive measures could also lead to improve the quality of life in adults promoting active and healthy aging
