Passive Vibration Isolation:

Passive Vibration Isolation Eugene I. Rivin, 2003 Provides background theory and practical solutions for engineers that face vibration problems causing equipment failure downtime and extra maintenance costs It emphasizes proven effective techniques that are not yet widely used on equipment for microelectronics MEMS and nanotechnology as well as process plants power generation oil gas petrochemicals and other industries Vibration isolation is a vibration control technique in which the source of vibration excitation and the object to be protected are separated by an auxiliary system comprising special devices called vibration isolators or vibration isolating mounts

Modeling and Analysis of Passive Vibration Isolation Systems Sudhir Kaul, 2021-08-31 Modeling and Analysis of Passive Vibration Isolation Systems discusses a wide range of dynamic models that can be used for the design and analysis of passive vibration isolation systems These models range from linear viscoelastic single degree of freedom systems to multiple degree of freedom nonlinear systems They can be used to evaluate hyperelasticity and creep and to represent the inertia effect for an evaluation of vibroacoustic characteristics at high frequencies This book also highlights specific nonlinear behavior displacement limiting designs hyperelastic behavior and characteristics associated with elastomeric materials for each model It also identifies key attributes limitations and constraints providing a holistic reference that can be used for the design and analysis of passive vibration isolators Modeling and Analysis of Passive Vibration Isolation Systems serves as a reference for engineers and researchers involved in the design development modeling analysis and testing of passive vibration isolation systems and as a reference for a graduate course in vibration modeling and analysis Outlines the use of multiple models for optimal passive vibration isolation system design Discusses the effects system design has on subsequent product development components and parameters Includes applied examples from the automotive aerospace civil engineering and machine tool industries Presents models that can be extended or modified to investigate different means of passive isolation nonlinearities and specific design configurations Considers specific elastomer characteristics such as Mullins and Payne effects for theoretical modeling and analysis

Comprehensive Investigation on Active-Passive Hybrid Isolation and Tunable Dynamic Vibration Absorption Fei Wang, Zhenping Weng, Lin He, 2018-12-17 This book discusses efforts to control the low frequency vibration transmission of typical power equipment and pipeline systems of ships exploring the use of active and passive hybrid vibration isolation and adjustable dynamic vibration absorption technologies It also proposes an adaptive feed forward control strategy and studies a distributed feed forward control hardware system In addition the book presents a three way dynamic vibration absorption theory used to design a pipeline system adjustable dynamic vibration absorber which offers a number of advantages such as compact structure easy assembly and disassembly low power consumption excellent vibration control effect and wide frequency band adjustable ability etc This book is a valuable resource for researchers and engineers in the fields of noise and vibration control active control systems active vibration isolation and adaptive dynamic vibration

The Department of Defense has identified launch vibration isolation as a major research interest Reducing the loads a satellite experiences during launch will greatly enhance the reliability lifetime and payload to structure ratio DoD satellite programs stand to benefit significantly from advances in vibration isolation technology This study explores potential hybrid vibration isolation control designs versus passive designs A simple lumped mass dynamic model of a satellite and a representative launch vehicle was designed using Simulink The analysis focuses on the various sources of transient launch accelerations such as aero acoustic loads separation events wind gusts and motor induced vibration The passive vibration suppression design reduced axial bounce modes Further reductions were made possible with an added active controller The results of modeling indicate that as much as a 90 percent improvement in loads on the satellite were recognized from the combination of active and passive vibration control techniques The model also explored the response of a sub component of the satellite payload For passive isolation the sub component remained near its low baseline level of response but for hybrid isolation the sub component is exposed to greater levels of loading as a function of passive isolation frequency This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work As a reproduction of a historical artifact this work may contain missing or blurred pages poor pictures errant marks etc Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant Whole Spacecraft Vibration Isolation System Behzad Jafari,2018 The launch phase is the harshest mechanical environment a spacecraft experiences through its lifetime The severity of the vibrations during the launch phase poses a serious challenge for the design of the spacecraft which generally contains many sensitive electronic components The need to guarantee the launch survival of the spacecraft has instigated a significant amount of research in the field of vibration isolation of the whole spacecraft which resulted in development of various passive vibration isolation systems and their widespread use since two decades ago The present study is aimed to analyze the feasibility of implementation of semi active vibration isolation system instead of a passive one

and to compare its potential benefits in attenuating the vibrations transmitted to the sensitive components of the spacecraft during the launch phase First the passive system has been studied and a methodology for design optimization of the multi degree of freedom system in frequency and time domain has been formulated The optimized passive system is then used as a baseline to compare the performance of the optimal passive isolator with that of a semi active system Semi active control strategies based on Skyhook SH and combined Skyhook and Acceleration Driven Damping SH ADD have been utilized to control the damping of the isolator between spacecraft and launch vehicle to attenuate vibration The results showed that while semi active system has a significant advantage over passive system to attenuate vibrations when the excitations are harmonic or narrow band the results are not as promising when broadband random excitation which is a realistic model of the excitations that the spacecraft experiences during launch is considered This calls into question the practical effectiveness of the semi active system to be used in whole spacecraft vibration isolation system Further research work with experimental tests are required to verify if semi active systems can have a practical application in whole spacecraft isolation system
