Prerational Intelligence: Adaptive Behavior and Intelligent Systems Without Symbols and Logic, Volume 1, Volume 2
Prerational Intelligence: Interdisciplinary Perspectives on the Behavior of Natural and Artificial Systems, Volume 3 Holk Cruse, Jeffrey Dean, Helge Ritter, 2013-11-11 The present book is the product of conferences held in Bielefeld at the Center for interdisciplinary Studies ZiF in connection with a year long ZiF Research Group with the theme Prerational intelligence The premise explored by the research group is that traditional notions of intelligent behavior which form the basis for much work in artificial intelligence and cognitive science presuppose many basic capabilities which are not trivial as more recent work in robotics and neuroscience has shown and that these capabilities may be best understood as emerging from interaction and cooperation in systems of simple agents elements that accept inputs from and act upon their surroundings The main focus is on the way animals and artificial systems process information about their surroundings in order to move and act adaptively The analysis of the collective properties of systems of interacting agents however is a problem that occurs repeatedly in many disciplines Therefore contributions from a wide variety of areas have been included in order to obtain a broad overview of phenomena that demonstrate complexity arising from simple interactions or can be described as adaptive behavior arising from the collective action of groups of agents To this end we have invited contributions on topics ranging from the development of complex structures and functions in systems ranging from cellular automata genetic codes and neural connectivity to social behavior and evolution Additional contributions discuss traditional concepts of intelligence and adaptive behavior 1

Prerational Intelligence Holk Cruse, Jeffrey Dean, Helge Ritter, 2000 The focus of prerational intelligence is on the way animals and artificial systems utilize information about their surroundings in order to behave intelligently the premise is that logic and symbolic reasoning are neither necessary nor possibly sufficient Experts in the fields of biology psychology robotics AI mathematics engineering computer science and philosophy review the evidence that intelligent behaviour can arise in systems of simple agents interacting according to simple rules that self organization and interaction with the environment are critical and that quick approximations may replace logical analyses It is argued that a better understanding of the intelligence inherent in procedure like those illustrated will eventually shed light on how rational intelligence is realised in humans Readership Scientifically literate general readers and scientists in all fields interested in understanding and duplicating biological intelligence
