techniques required in water quality modelling Advection dispersion and concentrated sources or sinks of contaminants lead to the formulation of the fundamental differential equation of pollutant transport Its integration according to appropriate initial and boundary conditions and with the knowledge of the velocity field allows for pollutant behaviour to be assessed in the entire water body An analytical integration is convenient only in one dimensional approach with considerable simplification Integration in the numerical field is useful for taking into account particular aspects of water body and pollutants To ensure their reliability the models require accurate calibration and validation based on proper data taken from direct measurements In addition sensitivity and uncertainty analysis are also of utmost importance All the above items are discussed in detail in the 21 chapters of the book which is written in a didactic form for professionals and students *Rivers and Streams* Jenny Vaughan, 1998 Presents basic information about rivers and streams how they are formed the animals that inhabit them and their effects on people *WATER QUALITY MODELING* AUTHOR; R.
