

# Solar Neutrino Detection

The neutrinos coming from the sun are all electron type neutrinos ( $\nu_e$ ):

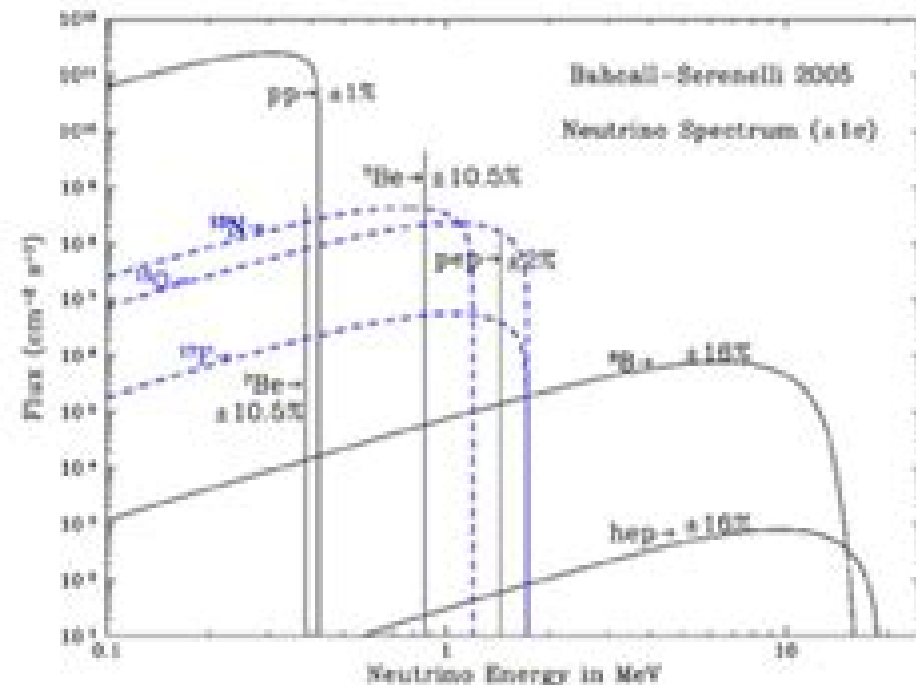

They come in many different energies (from 0.1 - 16 MeV).

We can detect them here on Earth with:

LARGE (due to low neutrino interaction rate)

UNDERGROUND (to reduce cosmic ray background (mostly  $\mu^{\pm}$ ))

 Arnold S. Lavro, 2002 Neutrinos are one of the most abundant particles in the universe Because they have very little  
 interaction with matter however they are incredibly difficult to detect Neutrinos are similar to the more familiar electron  
 with one crucial difference neutrinos do not carry electric charge Because neutrinos are electrically neutral they are not  
 affected by the electromagnetic forces which act on electrons Three types of neutrinos are known Each type or flavour of  
 neutrino is related to a charged particle which gives the corresponding neutrino its name Hence the electron neutrino is  
 associated with the electron and two other neutrinos are associated with heavier versions of the electron called the muon and  
 the tau The book presents citations from the literature for the last three years from the journal literature and the existent
