Pomante,2022-09-01 Modern electronic systems consist of a fairly heterogeneous set of components Today a single system can be constituted by a hardware platform frequently composed of a mix of analog and digital components and by several software application layers The hardware can include several heterogeneous microprocessors e g GPP DSP GPU etc dedicated ICs ASICs and or FPGAs memories a set of local connections between the system components and some interfaces between the system and the environment sensors actuators etc Therefore on the one hand multi processor embedded systems are capable of meeting the demand of processing power and flexibility of complex applications On the other hand such systems are very complex to design and optimize so that the design methodology plays a major role in determining the success of the products For these reasons to cope with the increasing system complexity the approaches typically used today are oriented towards co design methodologies working at the higher levels of abstraction Unfortunately such methodologies are typically customized for the specific application suffer of a lack of generality and still need a considerable effort when real size project are envisioned Therefore there is still the need for a general methodology able to support the designer during the high level steps of a co design flow enabling an effective design space exploration before tackling the low level steps and thus committing to the final technology This should prevent costly redesign loops In such a context the work described in this book composed of two parts aims at providing models methodologies and tools to support each step of the co design flow of embedded systems implemented by exploiting heterogeneous multi processor architectures mapped on distributed systems as well as fully integrated onto a single chip   *Motorola M68000 Family Reference* Motorola, Inc,1988

   Understanding Control Flow Peter A. Buhr,2016-09-24 The control flow issues presented in this textbook are extremely relevant in modern computer languages and programming styles In addition to the basic control flow mechanisms virtually all new computer languages provide some form of exceptional control flow to support robust programming introduced in this textbook Also concurrency capabilities are appearing with increasing frequency in both new and old programming languages and are covered in this book Understanding Control Flow With Concurrent Programming Using C starts with looping and works through each of the basic control flow concepts examining why each is fundamental and where it is useful Time is spent on each concept according to its level of difficulty Examples and exercises are also provided in this textbook New programming methodologies are requiring new forms of control flow and new programming languages are supporting these methodologies with new control structures such as the concurrency constructs discussed in this textbook Most computers now contain multi threading and multi cores while multiple processors and distributed systems are ubiquitous all of which require advanced programming methodologies to take full advantage of the available parallelism summarized in this textbook Advance forms of control flow are becoming basic programming skills needed by all programmers not just graduate students working in the operating systems or database disciplines This textbook is designed for advanced level students studying computer science and engineering Professionals and researchers working in this field
