Ultrasonic Processes and Machines V.K. Astashev, V. I. Babitsky, 2007-11-03 I don t mind your thinking slowly I mind your publishing faster than you think Wolfgang Pauli 1900 1958 Technologies that use high frequency ultrasonic vibration to intensify processes are gaining wide recognition in scientific and industrial environments By superimposing high frequency vibration the basic mechanical haviour of many processes and materials is seen to be transformed This leads to the development of new machines and processes with advanced characteristics Despite the fact that ultrasonic technology has been employed for many years there is no generalised understanding of ultrasonic machines and processes Their design and development has mainly been achieved using heuristic methods based on linear acoustical considerations This book is intended to bridge the gap between the theory and practical use of ultrasonic technology It presents generalised foundations for the dynamics and control of ultrasonic processing systems The main concept presented is to consider ultrasonic systems as special kinds of vibratory machines that function by exploiting nonlinear dynamic processes This assumes coupled considerations between the ultrasonic vibrations in use on the processes and the consequence of the transformed processing loads on the excitation and control of the working tools vibration Analysis is conducted in a unified manner and is based on structural and frequency methods that have become well established in engineering practice These methods are
