

TASK COMMITTEE REPORT ON RECOMMENDATIONS FOR STANDARDS IN HYDRAULICS

ASCE's interest in generating standards prompted its Hydraulics Division in 1991 to appoint a Task Committee for reporting on whether certain activities in hydraulic engineering should be standardized. At the outset, the answer seemed not immediately clear because the science of fluid mechanics, the foundation of hydraulic engineering, has elements that frequently defy prediction, let alone standardization. The Committee produced a report, "Recommendations for Standards in Hydraulics," in the format of an ASCE Special Publication so that information on this topic could be generally available and so that a synopsis could be published in the *Journal of Hydraulic Engineering*. The report was published in 1994 and is available from ASCE. This Forum Article is a synopsis of the report, the content and conclusions of which remain relevant today. The article aims at drawing attention to the report and its useful annotated summary of the many U.S. and foreign standards and guidelines in hydraulic engineering. It also aims at stimulating further discussion on standards in certain areas of hydraulic engineering.

Objectives

The Task Committee's initial objectives were limited to three:

- Determine if any activities in hydraulic engineering should be standardized.
- If standards are recommended, establish priorities for the topics and assess the effect of their standardization on the profession.
- Prepare a written report of findings.

However, once the Committee began its deliberations, additional objectives were established:

- Conduct a survey to determine the interest of practicing hydraulic engineers in additional guides and standards.
- Prepare an annotated bibliography of available guides and standards in hydraulics.

The Committee was specifically not charged with generating standards.

Approach

In recognition of the design implications of standards and guidelines, the Committee's membership was selected from engineering firms rather than academic circles. Its members evaluated their own experience and professional activities and discussed their findings. They quickly concluded that input from a broader base was required to provide a better consensus on the need for standards and guidelines. Therefore, practicing engineers were surveyed to determine what existing standards were being used and whether additional standards in hydraulics would be beneficial or harmful. It soon became apparent to the Committee that the profession in general was not fully aware of all the published standards and guides relating to hydraulics. Consequently, the Committee set out to prepare a list of such documents, both U.S. and international, and to annotate the entries such that the general content of the published material would be readily available to the profession. The Committee's report contains the annotated list with key

words to enable easy reference to available standards by technical topic.

Definitions

There are various definitions of standards and standardization. The generic term "standard" in ASCE terminology means a consensus document prepared by members and nonmembers of the Society in accordance with the Society's Rules for Standards Committees. ASCE defines a standard as "a prescribed set of rules, conditions, or requirements concerned with: definitions of terms; classification of components; delineation of design or operations; description of dimensions, materials, performance, design or operation; description of fit and measurement of size; or measurement of quality and quantity in describing materials, products, systems, services, or practices." Standards may be mandatory or nonmandatory.

A standard intended to be mandatory shall be enforceable and shall be worded so that a person auditing its application can point out where it has been followed, or the extent to which it has or has not been followed. Items of a nonmandatory nature included in a mandatory standard shall be placed in the commentary. Mandatory standards may cover test methods, specifications, designs, contract documents, or drawings, and may include standards intended for adoption in codes. Nonmandatory standards include guidelines that offer a series of options or instructions but do not recommend a specific course of action. They also include "standard practice," which gives a reasonably definitive procedure for performing one or more specific operations or functions. All standards should be suitable for repetitive use, definitive, realistic, technically sound, clear, and consistent, and should cover a limited scope. (The above descriptions are from "Procedures, Form, and Style for Standards of the ASCE Codes and Standards Committee.")

Pros and Cons

The main purpose of standards is quality assurance in technical performance and industrial production. Adherence to the respective standards will assure the use of an acceptable level of technology in industry and in professional practice. Standards are also helpful in allowing less developed countries to quickly assimilate methods and procedures that are compatible with those of highly industrialized countries. They establish a platform for further in-depth study and provide a checklist of items to be considered in the course of solving a problem. Standards fix a certain procedure whose development has reached sufficient maturity, so as to make it repeatable at different times and locations, under different circumstances, and by different people. They increase the likelihood of performance as expected and protect the user of engineering services which are supplied from diverse sources. Standards also assure that integral parts from different producers can be assembled into a functioning whole with a minimum of trouble and cost.

Many engineers view standardization with suspicion. They fear that standards impose a rigid framework and, therefore, act as a hindrance to engineering creativity, judgment, and competition. Though many things can be standardized, intelligent decisions must be made as to what should be standardized. These fears may be justified by recent experiences in European countries, where controlling the flood of standards creates a problem in itself. Standards do not necessarily fix procedures forever. The average life of a standard from its introduction until review is usually limited to about five years.

Standards give assurance that generally acknowledged rules of the technical state of the art are being applied to the pro-
