Recycled Materials In Geotechnics:

Recycled Materials in Geotechnics Ahmet H. Aydilek, Joseph Wartman, 2005 GSP 127 contains 15 papers highlighting the use of recycled materials in geotechnics presented in sessions of the ASCE Civil Engineering Conference and Exposition held in Baltimore Maryland October 19 21 2004 *Recycled Materials in Geotechnical Applications* Cumaraswamy Vipulanandan, David J. Elton, 1998 The 15 papers describe field applications and laboratory testing The topics include the geotechnics of industrial by products paper mill sludge for landfill cover tire shreds as lightweight fill for embankments and retaining walls the performance of a highway embankment and hydraulic barriers co **Recycled Materials in Geotechnical and Pavement Applications** Amin Chegenizadeh, Hamid Nikraz, 2022-02-28 This book considers the application of recycled materials both in pavement and geotechnical engineering Currently Australia has faced the fundamental concern of recycling waste plastic On 1 January 2018 China enforced a prohibition on the importation of waste plastic China's ban is followed by other countries like India Indonesia and Malaysia The ban caused many corporations to abandon waste collection agreements and the stockpiling of waste as there is nowhere to safely deposit this waste This issue seems to a great extent to have placed Australia's recycling industry in a crisis As a result local councils will have to find strategic ways of recycling accumulated waste that will become a more significant issue in the coming years In Australia apart from economic growth the road pavement has weakened rapidly as the current pavement unable to withstand this urgent traffic load demand The adding of polymers to the mixtures improves the stiffness rutting resistance and fatigue cracking 1 However the application of virgin polymer is costly Thus using waste polymer such as waste plastic polymer is an inexpensive substitute The potential for recycled plastic to improve the performance properties of asphalt mixtures has been demonstrated in many countries the UK Canada The Netherlands and India 2 Similarly another application of recycled materials can be in geotechnical infrastructure This book considers the application of recycled materials both in pavement and geotechnical engineering References 1 Airey G D Singleton T M Collop A C 2002 Properties of polymer modified bitumen after rubber bitumen interaction Journal of Materials in Civil Engineering 14 4 344 354 2 K O Farrell Australian Plastics Recycling Survey National Report Australian Government Department of Environment and Energy Australia Project reference 2018 A21502 **Recycled Materials in Geotechnics**, 2004 *Geomechanics and Geotechnics of Particulate Media* Masayuki Hyodo, Hidekazu Murata, Yukio Nakata, 2017-12-14 Microscopic re examination of geomaterials consisting of aggregates can shed light on macroscopic behaviour including compressibility anisotropy yielding creep cyclic liquefaction and shear rupture As a result of this process of examination new methods of material characterization emerge leading to a greater degree of accuracy in the specification of new constitutive models with physically meaningful parameters The impetus behind this development is an increasing awareness on sustainability leading to the more efficient use of recycled materials for geotechnical applications The characteristics of recycled materials such as compressibility and self hardening

may differ significantly from those of natural materials and it is crucial that evaluation is made from a specifically particulate perspective

Geotechnics of High Water Content Materials Tuncer B. Edil, Patrick Joseph Fox, 2000 Reasonable estimates indicate that approximately a billion cubic meters of high water content soil like wastes are produced annually worldwide and a large portion of these are deposited hydraulically in diked impoundment areas some of which are among the largest earth structures in the world The major problems emanating from this disposal method are the difficulty in dewatering the wastes their low strength and hydraulic conductivity their high compressibility their potential to contaminate the groundwater the stability of the confining dikes and the ultimate reclamation of the disturbed land Following a brief explanation of how many of these wastes are generated quantitative values for key engineering properties are summarized and compared for a wide variety of waste materials and some reference soils Then many concepts that have been applied with success will be presented together with the advantages each offers the difficulties involved in using it and the limitations in our knowledge Discussed briefly will be state of practice developments in mathematical modeling laboratory testing and associated interpretations and material property formulations
