Recent Developments in Separation Science Po Li. N N, 2018-05-04 Volume two of the series focuses on the topics of extraction filtration heatless adsorption hydrometallurgical extraction interfacial phenomena separation of gases by regenerative sorption various polymeric membrane systems such as electrodialysis ultrafiltration reverse osmosis Gas and liquid separations by selective permeation through polymeric membrane and the origin of separate system The last topic as a special feature of interest provides an analysis of the genesis and development of new separation techniques     **Separation of a highly nonideal mixture for solvent recovery** Andreas Raab, 2003-01-15 Inhaltsangabe Abstract The separation of complex nonideal mixtures is a common problem in the process industries The solvent recovery is an important task for chemical engineers to minimize burden upon the environment due to exhaustive use of solvents The recovery of the individual components is complicated by the highly nonideal features of these mixtures The separation of such highly nonideal mixtures can be limited by the presence of azeotropes which can create distillation boundaries These distillation boundaries are forming distillation regions which are difficult to overcome with the standard rectification Distillation systems for these highly nonideal azeotropic mixtures are particularly difficult to design and to operate in an efficient way In printing companies often four component mixtures of ethanol ethyl acetate isopropyl acetate and water arise as waste A separation scheme of multicomponent azeotropic distillation is developed and successfully used for a highly nonideal quaternary mixture The composition of the mixture in mass percent is ethanol 30% water 20% ethyl acetate 25% and isopropyl acetate with 20% The rest of the mixture 5% consists of n propane isopropane cyclohexane and etoxypropane For the further investigation just the quaternary mixture is examined Generally every component should be recovered as pure as possible from the mixture In the mixture namely five binary and two ternary azeotropes are formed by the components Based on the synthesis procedure proposed by Rev et al and Mizsey et al a new separation technology is developed followed up the vapor liquid liquid equilibrium behavior of the mixture They have recommended a general framework for designing feasible schemes of multicomponent azeotropic distillation This procedure recommends to study in detail the vapor liquid liquid equilibrium data to explore immiscibility regions azeotropic points and separatrices for ternary and quaternary regions On the behalf of the VLLE data the set of feasible separation structures is explored This procedure is followed and a new separation structure is developed and tested experimentally First the quaternary mixture is separated into two ternary mixtures by distillation The

two ternary mixtures containing ethyl acetate ethanol water and isopropyl acetate ethanol water respectively Due to the analogous behavior of the two ternary mixtures similar separation cycles can be designed The two **Food Analysis** Dieter W.
