The Circular Flow Model and the Biosphere

The Economic System and the Environment

A basic building block of economic theory is the standard “circular flow” model of an economic system. As illustrated in Figure 1, this model shows the exchange of goods, services, and factors of production between two types of economic actors, consumers (households) and producers (firms). However, the environment and the natural resources which make economic production possible do not appear in the usual version of this model.

When a good or service is purchased, two kinds of flow occur: the good moves from the firm to the household and a corresponding payment moves from the household to the firm. Similarly, when firms purchase factors of production, a payment of money for the use of these factors accompanies the flow of factor services from households to firms. These transactions are symbolized on the graph in Figure 1 by the arrows going in both directions – from firms to households and vice versa. We distinguish between the two kinds of flows, real economic flows and the monetary flows which are their counterpart. The former are called “real” as they correspond to transfers of tangible things: goods and services flowing from firms to households; factors of production flowing from households to firms.

Can we locate the environment or natural resources in this picture? Certainly natural resources are essential to production: [agriculture](#) requires productive soils, industry requires fuels, water, and minerals. Consumers need drinking water, and many environmental resources, such as beaches and woodland, are in high demand. How is all this reflected in the circular flow?
