Computational Intelligence - Volume I Hisao Ishibuchi, 2015-12-30 Computational intelligence is a component of Encyclopedia of Technology Information and Systems Management Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Computational intelligence is a rapidly growing research field including a wide variety of problem solving techniques inspired by nature Traditionally computational intelligence consists of three major research areas Neural Networks Fuzzy Systems and Evolutionary Computation Neural networks are mathematical models inspired by brains Neural networks have massively parallel network structures with many neurons and weighted connections Whereas each neuron has a simple input output relation a neural network with many neurons can realize a highly non linear complicated mapping Connection weights between neurons can be adjusted in an automated manner by a learning algorithm to realize a non linear mapping required in a particular application task Fuzzy systems are mathematical models proposed to handle inherent fuzziness in natural language For example it is very difficult to mathematically define the meaning of cold in everyday conversations such as It is cold today and Can I have cold water The meaning of cold may be different in a different situation Even in the same situation a different person may have a different meaning Fuzzy systems offer a mathematical mechanism to handle inherent fuzziness in natural language As a result fuzzy systems have been successfully applied to real world problems by extracting linguistic knowledge from human experts in the form of fuzzy IF THEN rules Evolutionary computation includes various population based search algorithms inspired by evolution in nature Those algorithms usually have the following three mechanisms fitness evaluation to measure the quality of each solution selection to choose good solutions from the current population and variation operators to generate offspring from parents Evolutionary computation has high applicability to a wide range of optimization problems with different characteristics since it does not need any explicit mathematical formulations of objective functions For example simulation based fitness evaluation is often used in evolutionary design Subjective fitness evaluation by a human user is also often used in evolutionary art and music These volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers

Petri Nets: Central Models and Their Properties Wilfried Brauer, Wolfgang Reisig, Grzegorz

Rozenberg,2006-04-11 Petri Nets represent a long and sustained effort to develop concepts theories and tools to aid in design and analysis of concurrent systems They are used in many areas of computer science including software engineering data base and in formation systems computer architecture and operating systems communication protocols and computer networks process control and socio technical systems such as office communication and man machine interaction Quite substantial theory has been developed for Petri Nets It reflects all major problem areas of concurrent distributed systems and covers many successfully applied principles and analysis techniques for systems organisation Since the time that C A Petri has presented his original ideas a rich body of knowledge has been developed a recent bibliography in Advances in Petri Nets 1981 includes more than 2000 entries Already in 1979 an Advanced Course on Petri Nets was organized in Hamburg West Germany aiming at systematizing the existing knowledge and making it well accessible to a wide audience of computer scientists interested in theory and applications of concurrent systems This course has turned out to be successful in the sense that it has initiated a lot of new research into applications and theory of Petri Nets This had led to another Advanced Course in 1986 in Bad Honnef West Germany where during two weeks more than 30 lectures were presented covering the most important current developments in the area of Petri Nets

Computational Logic Dov M. Gabbay,Jörg H. Siekmann,John Woods,2014-12-09 Handbook of the History of Logic brings to the development of logic the best in modern techniques of historical and interpretative scholarship Computational logic was born in the twentieth century and evolved in close symbiosis with the advent of the first electronic computers and the growing importance of computer science informatics and artificial intelligence With more than ten thousand people working in research and development of logic and logic related methods with several dozen international conferences and several times as many workshops addressing the growing richness and diversity of the field and with the foundational role and importance these methods now assume in mathematics computer science artificial intelligence cognitive science linguistics law and many engineering fields where logic related techniques are used inter alia to state and settle correctness issues the field has diversified in ways that even the pure logicians working in the early decades of the twentieth century could have hardly anticipated Logical calculi which capture an important aspect of human thought are now amenable to investigation with mathematical rigour and computational support and fertilized the early dreams of mechanised reasoning Calculemus The Dartmouth Conference in 1956 generally considered as the birthplace of artificial intelligence raised explicitly the hopes for the new possibilities that the advent of electronic computing machinery offered logical statements could now be executed on a machine with all the far reaching consequences that ultimately led to logic programming deduction systems for mathematics and engineering logical design and verification of computer software and hardware deductive databases and

software synthesis as well as logical techniques for analysis in the field of mechanical engineering This volume covers some of the main subareas of computational logic and its applications Chapters by leading authorities in the field Provides a forum where philosophers and scientists interact Comprehensive reference source on the history of logic

A Review of Ada Tasking Alan Burns, Andrew M. Lister, Andrew J. Wellings, 1987-06-24 Ada is unquestionably one of the most significant programming languages to emerge in the last decade The manner of its inception and support by the US Department of Defense DoD ensures that it will be used extensively for the indefinite future in programming large and complex systems The growing availability of compilers means that many organisations are already committed to using the language for sizable and significant applications As a perhaps inevitable result of its design goals Ada is a large language It has Pascal like control and type constructs a mechanism for exception handling a package structure for information hiding decomposition and separate compilation facilities for low level programming and a tasking model of concurrency It is perhaps this last area that has generated most debate criticism and disagreement The purpose of this book is to review the tasking model in the light of the extensive analysis and comment which has appeared in the literature The review is necessarily wide ranging including discussion of Ada as a general purpose concurrent programming language Ada as a language for embedded and distributed systems implementation issues with particular reference to distributed systems formal semantics specification and verification proposed language modifications By consolidating this discussion within the confines of a single review potential users of the tasking facility are enabled to familiarise themselves with all the factors which may impinge upon the performance reliability and correctness of their software The book also provides a focus for any debate on modifications to the Ada language or developments from it
