Nondifferentiable and Two-Level Mathematical Programming Kiyotaka Shimizu, Yo Ishizuka, Jonathan F. Bard, 2012-12-06 The analysis and design of engineering and industrial systems has come to rely heavily on the use of optimization techniques The theory developed over the last 40 years coupled with an increasing number of powerful computational procedures has made it possible to routinely solve problems arising in such diverse fields as aircraft design material flow curve fitting capital expansion and oil refining just to name a few Mathematical programming plays a central role in each of these areas and can be considered the primary tool for systems optimization Limits have been placed on the types of problems that can be solved though by the difficulty of handling functions that are not everywhere differentiable To deal with real applications it is often necessary to be able to optimize functions that while continuous are not differentiable in the classical sense As the title of the book indicates our chief concern is with i nondifferentiable mathematical programs and ii two level optimization problems In the first half of the book we study basic theory for general smooth and nonsmooth functions of many variables After providing some background we extend traditional differentiable nonlinear programming to the nondifferentiable case The term used for the resultant problem is nondifferentiable mathematical programming The major focus is on the derivation of optimality conditions for general nondifferentiable nonlinear programs We introduce the concept of the generalized gradient and derive Kuhn Tucker type optimality conditions for the corresponding formulations

Dynamic Programming Warren B. Powell,2007-10-05 A complete and accessible introduction to the real world applications of approximate dynamic programming With the growing levels of sophistication in modern day operations it is vital for practitioners to understand how to approach model and solve complex industrial problems Approximate Dynamic

Programming is a result of the author's decades of experience working in large industrial settings to develop practical and high quality solutions to problems that involve making decisions in the presence of uncertainty. This groundbreaking book uniquely integrates four distinct disciplines: Markov decision processes, mathematical programming, simulation, and statistics to demonstrate how to successfully model and solve a wide range of real life problems using the techniques of approximate dynamic programming (ADP). The reader is introduced to the three curses of dimensionality that impact complex problems and is also shown how the post decision state variable allows for the use of classical algorithmic strategies from operations research to treat complex stochastic optimization problems. Designed as an introduction and assuming no prior training in dynamic programming of any form, Approximate Dynamic Programming contains dozens of algorithms that are intended to serve as a starting point in the design of practical solutions for real problems. The book provides detailed coverage of implementation challenges including modeling complex sequential decision processes under uncertainty, identifying robust policies, designing and estimating value function approximations, choosing effective stepsize rules, and resolving convergence issues. With a focus on modeling and algorithms in conjunction with the language of mainstream operations research, artificial intelligence, and control theory, Approximate Dynamic Programming Models complex high dimensional problems in a natural and practical way which draws on years of industrial projects. Introduces and emphasizes the power of estimating a value function around the post decision state, allowing solution algorithms to be broken down into three fundamental steps: classical simulation, classical optimization, and classical statistics. Presents a thorough discussion of recursive estimation including fundamental theory and a number of issues that arise in the development of practical algorithms. Offers a variety of methods for approximating dynamic programs that have appeared in previous literature but that have never been presented in the coherent format of a book. Motivated by examples from modern day operations research, Approximate Dynamic Programming is an accessible introduction to dynamic modeling and is also a valuable guide for the development of high quality solutions to problems that exist in operations research and engineering. The clear and precise presentation of the material makes this an appropriate text for advanced undergraduate and beginning graduate courses while also serving as a reference for researchers and practitioners. A companion Web site is available for readers which includes additional exercises, solutions to exercises, and data sets to reinforce the book's main concepts.

Nonsmooth Approach to Optimization Problems with Equilibrium Constraints Jiri Outrata, M. Kocvara, J. Zowe, 2013-06-29. In the early fifties, applied mathematicians, engineers, and economists started to pay close attention to the optimization problems in which another lower level optimization problem arises as a side constraint. One of the motivating factors was the concept of the Stackelberg solution in game theory together with its economic applications. Other problems have been encountered in the seventies in natural sciences and engineering. Many of them are of practical importance and have been extensively studied mainly from the theoretical point of view. Later applications to mechanics and network design have led to an extension of the problem formulation. Constraints in form of

variational inequalities and complementarity problems were also admitted. The term generalized bi level programming problems was used at first but later probably in Harker and Pang 1988 a different terminology was introduced: Mathematical programs with equilibrium constraints or simply MPECs. In this book we adhere to MPEC terminology. A large number of papers deal with MPECs but to our knowledge there is only one monograph: Luo et al 1997. This monograph concentrates on optimality conditions and numerical methods. Our book is oriented similarly but we focus on those MPECs which can be treated by the implicit programming approach: the equilibrium constraint locally defines a certain implicit function and allows to convert the problem into a mathematical program with a nonsmooth objective.
