Chapin, Art Johnson, 2000 Written to help teachers deepen their understanding of the mathematics they teach the authors present a concise description of the mathematical ideas encountered in the elementary grades Each of the book s 13 chapters focuses on an important math topic and interspersed throughout each chapter are many activities that bring to life the mathematical information presented **Numerical Development - From cognitive functions to neural underpinnings** Korbinian Moeller, Elise Klein, Klaus F Willmes - von Hinckeldey, Karin Kucian, 2015-02-24 Living at the beginning of the 21st century requires being numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies Thus numerical development is at the core of both individual as well as societal interests There is the notion that we are already born with a very basic ability to deal with small numerosities Yet this often called number sense seems to be very restricted approximate and driven by perceptual constraints During our numerical development in formal e g school but also informal contexts e g family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits

refining our numerical capabilities In recent years numerical development has gained increasing research interest documented in a growing number of behavioural neuro scientific educational cross cultural and neuropsychological studies addressing this issue Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers

The Nature and Development of Mathematics John Adams, Patrick Barmby, Alex Mesoudi, 2017-04-21 From an infant's first grasp of quantity to Einstein's theory of relativity the human experience of number has intrigued researchers for centuries Numeracy and mathematics have played fundamental roles in the development of societies and civilisations and yet there is an essential mystery to these concepts evidenced by the fear many people still feel when confronted by apparently simple sums Including perspectives from anthropology education and psychology *The Nature and Development of Mathematics* addresses three core questions Is maths natural What is the impact of our culture and environment on mathematical thinking And how can we improve our mathematical ability Examining the cognitive processes that we use the origins of these skills and their cultural context and how learning and teaching can be supported in the classroom the book contextualises each issue within the wider field arguing that only by taking a cross disciplinary perspective can we fully understand what it means to be numerate as well as how we become numerate in our modern world This is a unique collection including contributions from a range of renowned international researchers It will be of interest to students and researchers across cognitive psychology cultural anthropology and educational research

technology argument revealing an unexpected advantage that humans have over our future robot masters we're actually good at mathematics There's so much discussion about the threat posed by intelligent machines that it sometimes seems as though we should simply surrender to our robot overlords now But Junaid Mubeen isn't ready to throw in the towel just yet As far as he is concerned we have the creative edge over computers because of a remarkable system of thought that humans have developed over the millennia It's familiar to us all but often badly taught in schools and misrepresented in popular discourse math Computers are of course brilliant at totting up sums pattern seeking and performing mindless tasks of well computation For all things calculation machines reign supreme But Junaid identifies seven areas of intelligence where humans can retain a crucial edge And in exploring these areas he opens up a fascinating world where we can develop our uniquely human mathematical talents Just a few of the fascinating subjects covered in MATHEMATICAL INTELLIGENCE include Humans are endowed with a natural sense of numbers that is based on approximation rather than precise calculation Our in-built estimation skills complement the precision of computers Interpreting the real world depends on both What sets humans apart from other animals is language and abstraction We have an extraordinary ability to create powerful representations of knowledge more diverse than the binary language of computers Mathematics confers the most robust logical framework for establishing permanent truths Reasoning shields us from the dubious claims of pure pattern recognition systems All mathematical truths are derived from a starting set of assumptions or axioms Unlike computers humans have the freedom to break free of convention and examine the logical consequences of our choices Mathematics rewards our imagination with fascinating and on occasion applicable concepts that originate from breaking the rules Computers can be tasked to solve a range of problems but which problems are worth the effort Questioning is as vital to our repertoire of thinking skills as problem solving itself *Gender differences and disparities in socialization contexts: How do they matter for healthy relationships, wellbeing, and achievement-related outcomes?* Caterina Fiorilli, Daniela Barni, Jan
