Representing And Acquiring Geographic Knowledge:

Representing and Acquiring Geographic Knowledge Ernest Davis, 1986 *Representing and Acquiring Geographic Knowledge* Ernest Simon Davis, YALE UNIV NEW HAVEN CT DEPT OF COMPUTER SCIENCE., 1984 This thesis presents a computational model of memory for spatial relations how knowledge of geography may be represented retrieved and acquired We focus particularly on the problems of representing incomplete and inexact information in a knowledge base and of learning a large scale area from a sequence of small scale views of the area Our model called MERCATOR includes an original representation scheme for two dimensional space routines that retrieve information from the knowledge base in useful form and a routine the assimilator that builds up a knowledge base incrementally from a sequence of scene descriptions All these have been implemented in a running computer program The representation approximates object boundaries in terms of sequences of straight edges and it records object positions in terms of the dimensions of edges Inexactness information is represented by recording bounds on edge dimensions and on the maximal distance from an edge to a boundary Incomplete information is represented by recording only part of the boundary and interior of an object This scheme is capable of representing many kinds of situations and of partial states of knowledge The assimilator consists of two parts The matcher finds correspondences between a scene description and the knowledge base The merger adds the new information from the scene description into the knowledge base The major result of this thesis is that a representation of space should integrate shape and positional information but should maintain an abstract level of geometric description separate from object descriptions **Foundations of Knowledge Acquisition** Alan L. Meyrowitz, Susan

Chipman, 2007-08-19 One of the most intriguing questions about the new computer technology that has appeared over the past few decades is whether we humans will ever be able to make computers learn As is painfully obvious to even the most casual computer user most current computers do not Yet if we could devise learning techniques that enable computers to routinely improve their performance through experience the impact would be enormous The result would be an explosion of new computer applications that would suddenly become economically feasible e g personalized computer assistants that automatically tune themselves to the needs of individual users and a dramatic improvement in the quality of current computer applications e g imagine an airline scheduling program that improves its scheduling method based on analyzing past delays And while the potential economic impact of successful learning methods is sufficient reason to invest in research into machine learning there is a second significant reason studying machine learning helps us understand our own human learning abilities and disabilities leading to the possibility of improved methods in education While many open questions remain about the methods by which machines and humans might learn significant progress has been made

Knowledge-Based Systems, Four-Volume Set Cornelius T. Leondes, 2000-07-11 The design of knowledge systems is finding myriad applications from corporate databases to general decision support in areas as diverse as engineering

manufacturing and other industrial processes medicine business and economics In engineering for example knowledge bases can be utilized for reliable electric power system operation In medicine they support complex diagnoses while in business they inform the process of strategic planning Programmed securities trading and the defeat of chess champion Kasparov by IBM's Big Blue are two familiar examples of dedicated knowledge bases in combination with an expert system for decision making With volumes covering Implementation Optimization Computer Techniques and Systems and Applications this comprehensive set constitutes a unique reference source for students practitioners and researchers in computer science engineering and the broad range of applications areas for knowledge based systems

Handbook on Architectures of Information Systems Peter Bernus, Kai Mertins, Günter Schmidt, 2013-03-14 This book is the first volume of a running series under the title International Handbooks on Information Systems The series is edited by Peter Bemus Jacek Blazewicz Günter Schmidt and Mike Shaw One objective is to give state of the art surveys on selected topics of information systems theory and applications To this end a distinguished international group of academics and practitioners are invited to provide a reference source not only for problem solvers in business industry and government but also for professional researchers and graduate students It seemed appropriate to start the series with a volume covering some basic aspects about information systems The focus of the first volume is therefore architectures It was decided to have a balanced number of contributions from academia and practitioners The structure of the material follows a differentiation between modelling languages tools and methodologies These are collected into separate parts allowing the reader of the handbook a better comparison of the contributions Information systems are a major component of the entire enterprise and the reader will notice that many contributions could just as easily have been included in another volume of the series which is on enterprise integration Conversely some traditionally information systems topics as organisational analysis and strategic change management methods will be treated in more depth in the Handbook on Enterprise Integration The two volumes will complement each other

Mental Representation and Processing of Geographic Knowledge Thomas Barkowsky, 2003-07-01 In cognitive

science mental representations of spatial knowledge are metaphorically referred to as cognitive maps However investigations in cognitive psychology reveal that the cognitive map metaphor is inadequate and that more suitable conceptions of human spatial knowledge processing are needed This book addresses mental processing of knowledge about geographic space from an AI point of view by presenting an experimental computational modeling approach Results about human memory and visual mental imagery from cognitive psychology are combined with AI techniques of spatial and diagrammatic knowledge processing The author develops the diagrammatic reasoning architecture MIRAGE as a comprehensive conception of human geographic knowledge processing
